### Units of Measurement

Compilations used in this report are in inch-pound units of measurement. Factors for converting inch-pound units to metric units are listed below.

<u>Inch-pound units</u>	<u>Conversion factor</u>	<u>Metric units</u>
inch (in)	25.4	millimeter (mm)
feet (ft)	.3048	meters (m)
cubic foot per second (ft <sup>3</sup> /s)	.0283	cubic meter per second (m <sup>3</sup> /s)

Multiply inch-pound units by conversion factor to obtain metric units.

#### ABSTRACT

The Gainesville Lock and Dam is the first of ten lock and dam projects on the Tennessee-Tombigbee Waterway to be completed. The structure was completed in 1978 and filling of the reservoir commenced March 20, 1978 resulting in changes in stream stage and discharge, ground-water levels, and chemical quality of the water.

#### INTRODUCTION

The U.S. Army Corps of Engineers requested the U.S. Geological Survey to collect specific data on water resources during the filling of the reservoir at Gainesville Lock and Dam. Locations of the data collection sites are shown in figure 1 and described in table 1. This report documents changes in stage and discharge, chemical quality, and changes in ground-water levels near the structure between March 13 and October 18, 1978.

The Gainesville Lock and Dam is on the Tombigbee River at river mile 238.8. A generalized plan of the structure is shown in figure 2. The dam has five tainter gates 50 feet wide and a fixed spillway 207 feet wide. The navigation lock, 110 feet wide and 600 feet long, is in the cut-off canal southeast of the dam.

#### DATA COLLECTION

Stage records were collected at nine surface-water sites and discharge records at five sites prior to and during filling of the reservoir. The data collected at these sites are contained in figures 3 to 11 and tables 2 to 10.

Ground-water levels in the vicinity of the dam are shown in figure 11. The periods of record are summarized in table 1.

Samples for complete chemical quality analyses, with selected minor element determinations, were obtained March 16, 17, and 21, 1978 and July 21, 22, 1978. Results of the analyses are given in tables 11-13. These samples were collected at sites about one mile upstream and one mile downstream from Gainesville Dam, and at Tombigbee River (02449000) at Gainesville.

## INSTRUMENTATION

When completed, the lock and dam will be instrumented to record gate position, headwater elevation, tailwater elevation, number of lockages, water-quality parameters, and weather data. Instrumentation was incomplete, but tainter gate position, headwater and tailwater elevation recorders, and a water-quality monitor were operational when the reservoir began filling.

Methods used to compute streamflow through the dam are described in a report by Collins, 1977.
