GROUND-WATER QUALITY AND DATA ON WELLS AND
SPRINGS IN PENNSYLVANIA, VOLUME I--OHIO AND
ST. LAWRENCE RIVER BASINS

By Harry E. Koester and Denise R. Miller

ABSTRACT

Volume I presents ground-water quality and physical data on about 1,200 well and spring sites in the Ohio and St. Lawrence River basins in Pennsylvania. Locations are shown on site-location maps derived from the hydrologic unit map. Codes showing the geologic age and aquifer are provided.

INTRODUCTION

The U.S. Geological Survey, in cooperation with the Bureau of Water Quality Management, Pennsylvania Department of Environmental Resources, began a state-wide ground-water study in September 1977. A growing interest in a background appraisal of Pennsylvania's ground-water supply was caused by the Three Mile Island nuclear reactor accident in March 1979 and by recent Federal and State legislation concerning performance standards on ground-water pollution protection. Results from the cooperative program with the Bureau of Water Quality Management will aid water users in locating ground-water problem areas relative to land-use planning and management and will be useful to well drillers, water-supply engineers, community planners, consultants, and local residents.

Ground-water investigations have been made cooperatively between the U.S. Geological Survey and the Pennsylvania Department of Environmental Resources since 1925. From numerous investigations of the past, ground-water quality data have been collected from about 4,000 wells and springs in Pennsylvania, and these data are presented in three volumes. This volume presents ground-water quality data from about 1,200 sites in the Ohio and St. Lawrence River basins. Two other volumes include ground-water quality in the Susquehanna and Potomac River basins and the Delaware River basin.

The reports are compilations of ground-water quality data and much of the physical well data for the period of record in Pennsylvania. Analyses and well information from both U.S. Geological Survey and Commonwealth files have been entered into the National computer system and are available to potential users. Data for sampled sites include locations and altitudes (elevation of land surface datum), records of water levels, well depths, depth to top of sampled interval (commonly the casing depth), and yields of wells and springs. Except where noted, chemical analyses of Pennsylvania ground water were done in laboratories of the U.S. Geological Survey through 1979. Analyses of ground water done after 1979 will be published in the annual series titled "Water Resources Data for Pennsylvania."

The tabulated wells and springs with ground-water analyses of major chemical constituents may have trace element analyses at the end of each table. No trace element data will be found for wells or springs that are not also listed with the major ions.

ACKNOWLEDGMENTS

The ground-water data included in this report have been obtained primarily by cooperative water-resources investigations with the Pennsylvania Department of Environmental Resources. The authors are grateful to the Bureau of Water Quality Management for cooperative support, and special thanks are extended to Kathleen Older, William E. Kochanov, Nicholas Molina, and Charles M. Swokel for their efforts in locating many of the county wells on base maps and in supplying missing data to the tables from well schedules. Well sites were plotted on the 1:500,000 scale hydrologic unit base map by use of the Ohio District's (USGS) drum plotter.

WELL-NUMBERING SYSTEM

Records of wells or springs are listed first by county well number, and second, by station identification number (combination of latitude, longitude and sequential number). The number has 15 digits, denoting the degrees, minutes, and seconds of latitude and longitude within a 1-second grid from the southeast corner. Locations within each watershed area (hydrologic unit) can be found on the site-location maps.

Data sites in a hydrologic unit are numbered in each county in the order in which they were inventoried; thus, CR-99 is the 99th data site inventoried in Clarion County, Pennsylvania. The county prefixes are not shown on the location maps but are included in the tables. County prefixes used in well numbering in the Ohio River and St. Lawrence River basins of Pennsylvania are shown in table 1.

CW - Crawford	SO - Somerset
EK - Elk	VE - Venango
ER - Erie	WR - Warren
FA - Fayette	WS - Washington
FO - Forest	WE - Westmoreland

UNITS AND TERMS IN TABLES

The results of chemical analyses and water temperatures are given in metric units. Other tabular data are in inch-pound units.

Chemical concentrations in solution are given in milligrams per liter (mg/L, MG/L) or in micrograms per liter (μ g/L, UG/L). Milligrams per liter is the unit of weight (milligrams) of solute per unit volume (liter) of water. One thousand micrograms per liter is equivalent to 1 milligram per liter. For concentrations of about 7,000 milligrams per liter or less, the values are equal to parts per million.

Water temperature in degrees Celsius ($^{\circ}$ C) can be converted to degrees Fahrenheit ($^{\circ}$ F) by the equation: $^{\circ}$ F = $9/5$ ($^{\circ}$ C) + 32. Temperatures are reported to the nearest 0.1 $^{\circ}$ C.

Specific conductance is a measure of the ability of water to carry an electric current and is expressed in micromhos per centimeter at 15 $^{\circ}$ C. For most waters, the specific conductance multiplied by 0.6 to 0.7 is an approximation of the concentration of dissolved solids (residue at 180 $^{\circ}$ C) in milligrams per liter.

The pH is an expression of the concentration of hydrogen ions in solution (reciprocal) and provides an effective and convenient measure of acidity or basicity of a solution. A pH 7 is considered neutral, less than 7 acidic, and more than 7 basic.

Hardness as calcium and magnesium is reported in milligrams per liter as an equivalent amount of calcium carbonate. It is commonly recognized as a physico-chemical characteristic that prevents the lathering of soap.

Depth of well, depth to top of sample interval, and water-level depth are given in feet with reference to the elevation of land-surface datum (LSD). They are all based on the National Geodetic Vertical Datum of 1929 (NGVD) that represents the average sea level over many years.

CODING OF NAMES OF GEOLOGIC UNITS

The geologic units used in this report are the aquifers (water-bearing formations) from which the water was obtained for the analyses in the chemical tables. The lithologic and hydrologic characteristics of these geologic units are briefly described in the Commonwealth geologic map (1960, and in press, 1980) and in many Pennsylvania Geological Survey publications. The geologic units, age, and codes listed in table 2, are the usage of the Pennsylvania Geological Survey and differ somewhat from the usage of the U.S. Geological Survey. Some names have not been adopted; rank and age designations of some units differ.

CODING OF HYDROLOGIC UNITS

The hydrologic unit (from the "Hydrologic Unit Map," 1974, U.S. Government Printing Office) is identified by an 8-digit number (fig. 1). The hydrologic unit, as delineated by the Office of Water Data Coordination, has distinct hydrographic boundaries of basins, subbasins, and parts of basins that are basically uniform watershed areas.

Table 2.--Names and codes of geologic units

<u>System or series</u>	<u>Code</u>	<u>Geologic Unit</u>
Holocene	111ALVM	Alluvium
