Principal Facts of Gravity Data.....	8
--------------------------------------	---

Introduction

During the summers of 1978 and 1979, 211 gravity stations were established in the Selway-Bitterroot Wilderness area (Fig. 1). The data were obtained as part of the U.S. Geological Survey's (USGS) program to evaluate the mineral-resource potential of wilderness areas. This gravity survey complements a gravity study of the proposed Blue Joint, Magruder and Meadow Creek wilderness study areas (Bankey and others, 1980).

Data Collection

Gravity observations were made using LaCoste-Romberg meter G-235 and Worden meter E-134¹. The stations were referenced to local USGS bases described in Appendix A. The USGS bases were tied to the U.S. Department of Defense base 3936-2 in Grangeville, Idaho and base 0442-0 in Missoula, Mont. Both base are part of the International Gravity Standardization Net, IGSN-71 (Defense Mapping Agency Aerospace Center, 1974). Complete base descriptions are included at the end of this report.

Elevation Control

Station elevations were obtained from surveyed bench marks, spot elevations, and contour interpolations on USGS topographic maps at a scale of 1:24,000. Elevation accuracy is estimated to vary from 0.2 meters for bench marks to 6 meters for contour interpolations. The maximum resultant error of the Bouguer anomaly is estimated to be less than 2 mgal (milligals) for an assumed density of 2.67 g/cm³.

¹Use of brand names in this report is for descriptive purposes only, and in no way constitutes endorsement by the U.S. Geological Survey.

Data Reduction

Programs existing on the USGS Honeywell¹ computer system were used to reduce the gravity data. An unpublished program by D. A. Dansereau and R. R. Wahl (U.S. Geological Survey, 1975) was used to calculate earth-tide and linear meter-drift corrections. The theoretical gravity value was calculated using the 1967 formula of the Geodetic Reference System (International Association of Geodesy, 1967). An unpublished program by R. H. Godson (U.S. Geological Survey, 1978) was used to compute terrain corrections for the area from each station out to 166.7 km using the method of Plouff (1977). The program uses mean elevation data on a 15 second grid for corrections from 0 to 5 km; 1 minute terrain data for corrections from 5 to 21 km; and 3 minute terrain data for corrections from 21 to 166.7 km. This program also calculates earth curvature corrections and complete (terrain-corrected) Bouguer anomaly values. Corrections for terrain ranged from 0.95 mgal to 30.98 mgal. Two complete Bouguer anomaly values per station were obtained assuming average rock densities of 2.67 g/cm³ and 2.45 g/cm³. The corrections and anomaly values are listed in Appendix B.
