ABSTRACT

Thirty water samples were collected from the Mineral Mountains, west-central Utah, during the summer of 1978, as a part of a hydrogeochemical study of the area. The water samples were analyzed for calcium, magnesium, sodium, potassium, lithium, silica, alkalinity, sulfate, chloride, fluoride, zinc, copper, molybdenum, arsenic, and uranium. Temperature, specific conductance, and pH were also measured. The results of the sample analyses are presented in this report.

INTRODUCTION

Thirty water samples were collected from twenty-one springs, five wells, three surface streams, and one mine adit during June of 1978, in the Mineral Mountains, Utah. The Mineral Mountains are in west-central Utah. Figure 1 is an index map of the study area.

Temperatures were measured at the sample site. The pH was measured on the day of collection, but not at the sample site. The remaining analyses were completed at the U.S. Geological Survey laboratory in Denver, Colorado. The results of the analyses are given in this report.

The data in this report were used for interpretation in the preparation of an earlier report (Miller and others, 1979).

SAMPLE COLLECTION TECHNIQUE

Samples were collected using acid-rinsed polyethylene bottles. At each locality, a 60-mL sample was collected, filtered through a 0.45- μ m membrane filter, and acidified with reagent-grade concentrated nitric acid to pH<2. An untreated 0.5-L sample was also taken.

Figure 1.-- Index map of Mineral Mountains, Utah

ANALYTICAL TECHNIQUES

Water temperature was measured at the sample site. The pH was measured on the day of collection, but not at the sample site. The remaining analyses were carried out in the laboratory of the U.S. Geological Survey in Denver, Colorado. Alaklinity, sulfate, chloride, fluoride, and specific conductance were determined using the untreated sample. Calcium, magnesium, sodium, potassium, lithium, silica, zinc, copper, molybdenum, arsenic, and uranium were determined using the 0.45- μ m filtered and acidified sample.

Specific conductance and pH were measured using standard instrumental methods. Alkalinity was determined by Gran's plot potentiometric titration (Orion Research, 1978). Sulfate, chloride, and fluoride were analyzed by ion chromatography (Smee and Hall, 1978, p. 245). Calcium, magnesium, sodium, potassium, lithium, silica, and zinc were analyzed by flame atomic absorption spectrophotometry (Perkin-Elmer Corp., 1976). Copper, molybdenum, and arsenic were analyzed by flameless atomic spectrophotometry (Perkin-Elmer Corp., 1977). Uranium was analyzed by a fluorometric method (McHugh, 1979).

RESULTS

Sample locality numbers and sample sources are shown in table 1. Table 2 shows analytical data for each sample locality, as well as the locality's latitude and longitude in degrees, minutes, and seconds. Table 3 is a summary of the chemical analyses for the 30 Mineral Mountain water samples showing each variable with its minimum and maximum values, mean, geometric mean, standard deviation, and geometric deviation.
