WESTERN HEMISPHERE
STRONG-MOTION ACCELEROGRAPH
STATION LIST - 1980

Compiled by
J. Switzer, D. Johnson, R. Maley and R. Matthiesen

OPEN FILE REPORT
No. 81-664

This report is preliminary and has not
been reviewed for conformity with U.S.
Geological Survey editorial standards.

314117

Prepared on behalf of the
National Science Foundation

January 1981

PREFACE

The U.S. Geological Survey (USGS) operates a strong-motion instrumentation program in cooperation with other federal, state, and local agencies within the United States. In addition, cooperation is extended to similar groups in other countries throughout the world. This list of stations brings into one document information on all stations in the western hemisphere known to the USGS.

No list of this type can be complete since only partial information is available on the more recently installed stations. Furthermore, in view of the rapid expansion of several networks no information is yet available on some stations. This list is as complete as practicable as of January 1, 1981.

Section I - Alphabetical List of stations	
Stations in Canada	I-1
Stations in the United States	I-4
Stations in Mexico	I-76
Stations in the Caribbean	I-79
Stations in Central America	I-81
Stations in South America	I-84
Section II - Numerical list of stations	II-1
Section III - Other agency station numbers	III-1
Section IV - Three character designations	IV-1
Section V - Obsolete station names	V-1
Appendix - Building Code and Owner Maintained Stations	A-1

INTRODUCTION

This list contains information on western hemisphere strong-motion stations that have been installed and are maintained by many different organizations. It contains information on all of those stations for which there is some data in the files of the USGS, but the list is incomplete even for stations in the United States. Since the stations being maintained are continuously changing, it is impossible to have complete information about all of the stations at any one time. The objective is to provide the community of persons who have an interest in strong-motion programs an indication of the current status of the networks in this part of the world. The USGS also maintains a computerized Strong Motion Information Retrieval System (SMIRS) which permits searching for various types of information about the strong motion stations, records, and events (Converse, 1978). In general, the information in SMIRS is more current than the information in this list.

For convenience, the list has been arranged by country, north to south, alphabetically by states in the section for the United States, and then alphabetically by station name. Subsequent sections include a list by stations numbers, a cross-reference of obsolete station names, a cross-reference of station numbers as assigned by other agencies, and a cross-reference of three character designations for those that find that form of station designation useful. A list of the stations that were installed as required by a local building code or that are maintained by the owner of the facility appears in the Appendix. That list has not been updated since 1976 at which time the USGS stopped receiving information about new installations required by building codes.

Numbering

A numerical list of the stations is given in Section II, and the regionalization of the stations by number is evident. In those regions encompassing several states, the station identification is followed by the standard two letter abbreviation for the state. If the individual instrument locations have been numbered in a previous list, only the lowest number is given a station identification in this list. The numbers previously assigned to the other instruments at the station are followed by the notation "see...". For those cases in which duplicate numbers have been assigned to the same station, the station number is followed by the notation "same as...". Once a number has been assigned, it is intended that the number not be used again even though duplicate numbers may have been assigned or the station may have been abandoned.

In the alphabetical list, the station numbers are those assigned by the USGS and used in the computerized information retrieval system. When other agencies have assigned station numbers to their stations, these are indicated in the cross-reference in Section III. Initially, the USGS numbering of stations was on a regional basis, but that has been altered in some cases. Only one number is assigned to a structure such as a building, bridge or dam although there may be several accelerographs installed at various locations in and near the structure, and its appurtenances.

Three character Designations

Recently, others have been assigning three character station designations for use in conjunction with existing computer programs for data processing and retrieval. In order to standardize the designation of existing strong-motion stations when they are designated in that manner, a three character station designation has been created for each of the stations in this list. These are shown beneath the station number in the alphabetical list, and cross-referenced in Section IV.

Names of Stations

The station name is that which is believed to be the name most commonly used by the agency that maintains each station. Ground stations are often named after the closest landmark such as a town, a hill, or a canyon, etc. Prominent facilities, such as dams, pumping plants, and reservoirs are listed under the name of the facility. Buildings are listed under the city in which they are located and then either under the name of the building or the street address. In Los Angeles, the practice of using the street address became common after the San Fernando earthquake. In many other cities, the building name was generally used, but that practice has been changing. To facilitate use of the list, all names that are known to have been used on past records are cross-referenced to the names used in Section V.

Site and Structure Characteristics

The brief description of site and structure characteristics is intended to aid in the estimation of the effect of the site and of the presence of the structure on the motions recorded at each site. The brief site descriptions represent an interpretation of the conditions at each station based on data presently in the USGS stations files. At numerous locations core logs have been obtained showing the soil profile directly beneath the accelerograph station. These soil logs, although providing specific information about the site, must be carefully interpreted since they generally begin at the original ground surface and do not allow for the removal of material during construction. In other instances, the depths to soil or rock interfaces were estimated on the basis of nearby soil logs, published geologic cross-sections, or shallow refraction surveys. The information is intended to be used in preliminary studies or in planning of further research studies. For detailed studies of the records and the influence of site conditions, reference should be made to other sources. The information listed can be used as a preliminary indication that more detailed data is available. Similar remarks apply to the information about the structures at each station. The descriptions of the structures should only be used for preliminary studies. More detailed information should be sought for further studies of the influence of the presence of the structure on the measured ground motion or studies of the response of the structure itself.

Other Information

In the present list, much of the information is only partly complete. As additional information is gathered and placed in the station files, it will be included in future station lists and in SMIRS. For additional information, a source for the data on each station is given in the list. These sources should be consulted for additional or more detailed information about the stations and the site characteristics.

The information regarding the instrument constants that was given in earlier instrument lists is not included here since that information is not of general interest. It is available on request to anyone who needs it for data reduction or data processing and is being included in the computerized information retrieval system.

SMIRS

A strong-motion information retrieval system (SMIRS) has been developed to provide up-to-date information about strong-motion records and the circumstances in which they were recorded. The system is accessible through a data terminal (30 cps, half duplex). To retrieve information, dial (415) 329-8600 and place the telephone handset into the terminal. When the carrier light comes on, press the "line-feed" key and wait for the computer to respond (two lines will be printed); type the following:

enter yourname SMIRS

Type the "enter" and "SMIRS" exactly as shown above, but replace "yourname" with your own name. The word "enter" is five lowercase characters followed by one space; your name is typed as one continuous character string and followed by one space; and "SMIRS" is five uppercase characters. Type the carriage-return key and then the line-feed key; then you will be given instructions. A users's manual is available and the system can be accessed through TYMNET.

ACKNOWLEDGMENT

The U.S. Geological Survey appreciates the assistance given by numerous individuals who provided information on the stations in their strong-motion networks. Without their assistance this report would be considerably less comprehensive.

NOTES AND ABBREVIATIONS

An asterisk (*) following the station number indicates a discontinued station, whereas a number mark (#) indicates an owner maintained station.

Two letter abbreviations for the states

Alabama	AL	Montana	MT
Alaska	AK	Nebraska	NE
Arizona	AZ	Nevada	NV

APPENDIX

Building Code and Other Regulations Station
for which no significant records are known to be

The following list of knowledge stations the
were established as result of local building and
not and have been up to date since then when
to the Engineering Branch records installation of
with instruments. Information regarding the new
installation of instruments required by building
code has not been received.

APPENDIX

Building Code and Owner Maintained Stations for which no significant records are known to exist

The following list of accelerograph stations that were established as result of local building codes has not been brought up-to-date since 1976 when the Seismic Engineering Branch ceased installation of such instruments. Information regarding the newer installations of instruments required by building codes has not been received.
