UNITED STATES DEPARTMENT OF THE INTERIOR
GEOLICAL SURVEY

OPEN-FILE REPORT 81-724
SHEET 3 OF 9

INTRODUCTION

The location of the Star Point Sandstone and the Blackhawk Formation in this area has been determined by the joint efforts of the authors, who have studied the area for several years. The Star Point Sandstone is a well-defined, prominent sandstone unit that can be traced over a large area. The Blackhawk Formation is a facies of sandstone and shale that is associated with the Sandstone. The studies of the area have been conducted by using a combination of field mapping, aerial photography, and geological observations.

DETAILED DESCRIPTION

The Star Point Sandstone is a well-defined sandstone unit that can be traced over a large area. The Blackhawk Formation is a facies of sandstone and shale that is associated with the Sandstone. The studies of the area have been conducted by using a combination of field mapping, aerial photography, and geological observations.

DIAGRAMMATIC CROSS SECTION

The following diagrammatic cross section shows the relationship between the Star Point Sandstone and the Blackhawk Formation. The star point sandstone is shown in light blue, and the blackhawk formation is shown in dark blue. The coal beds are shown in red. The cross section is oriented with north at the top.

COAL BEDS

The following diagrammatic cross section shows the relationship between the Star Point Sandstone and the Blackhawk Formation. The star point sandstone is shown in light blue, and the blackhawk formation is shown in dark blue. The coal beds are shown in red. The cross section is oriented with north at the top.

EXPLANATION

- Star Point Sandstone
- Blackhawk Formation
- Coal Bed

DIAGRAMMATIC CROSS SECTION
