LANDSLIDES AND RELATED FEATURES
OF THE METTLER, N.W., URBAN

USGS, 1964

Landslides and related features have been interpreted on this map. The map shows the location and extent of landslides, as well as the areas affected by landslide activity. The map includes detailed information on the类型 of landslides, such as debris flows, mudflows, and rockslides, and provides a useful tool for researchers and planners in assessing landslide risks and developing mitigation strategies. The map is a valuable resource for understanding the geomorphological processes that contribute to landslide formation and for predicting areas at risk of future landslides.
