IRRIGATION DATA FROM CHASE, DUNDY, AND PERKINS COUNTIES, SOUTHWESTERN NEBRASKA, 1984

By Diane M. Stephens, Frederick J. Heimes, and Richard R. Luckey

ABSTRACT

This report summarizes irrigation data collected by the U.S. Geological Survey in Chase, Dundy, and Perkins Counties, southwestern Nebraska. The data were collected as part of a study to better define the relationship between pumpage for irrigation and return flow from applied water (irrigation plus precipitation). The report contains data on crops, site location, discharge, time of operation, and water application for 57 randomly selected irrigation wells that were monitored during the 1984 irrigation season.

INTRODUCTION

The study area consists of Chase, Dundy, and Perkins Counties in southwestern Nebraska (fig. 1). The three counties have a total area of 2,700 mi^2 with 895 mi^2 in Chase County, 920 mi^2 in Dundy County, and 885 mi^2 in Perkins County. The study area is in the High Plains section of the Great Plains physiographic province. Most of the area consists of gently rolling uplands with many small flat areas (Lappala 1978). The southwestern part of the area contains sandhills and some small, interdune lakes and marshes. The area is drained by small streams that flow eastward. Bottomlands along the streams comprise a small percentage of the study area.

Irrigation in the study area is nearly all from ground water. There are about 2,800 irrigation wells in the three-county area. About 45 percent of these wells are in Chase County, 26 percent in Dundy County, and 29 percent in Perkins County. Most of the irrigation systems are center-pivot sprinklers. In Chase County, 74 percent of the irrigation systems are center-pivot sprinklers; in Dundy and Perkins Counties 91 percent of the irrigation systems are center-pivot sprinklers. A typical center-pivot sprinkler system irrigates about 130 acres. Flood-irrigation systems generally use gated-irrigation pipe.

Corn, the major irrigated crop in all three counties, accounts for 70 percent of all irrigated crops. Wheat, the second most commonly irrigated crop, only accounts for 10 percent of all irrigated crops. Dry beans, sorghum, alfalfa, and other crops also are irrigated in the study area. In recent years, the trend has been to replace irrigated corn with crops that need less irrigation water such as wheat, dry beans, and sorghum.

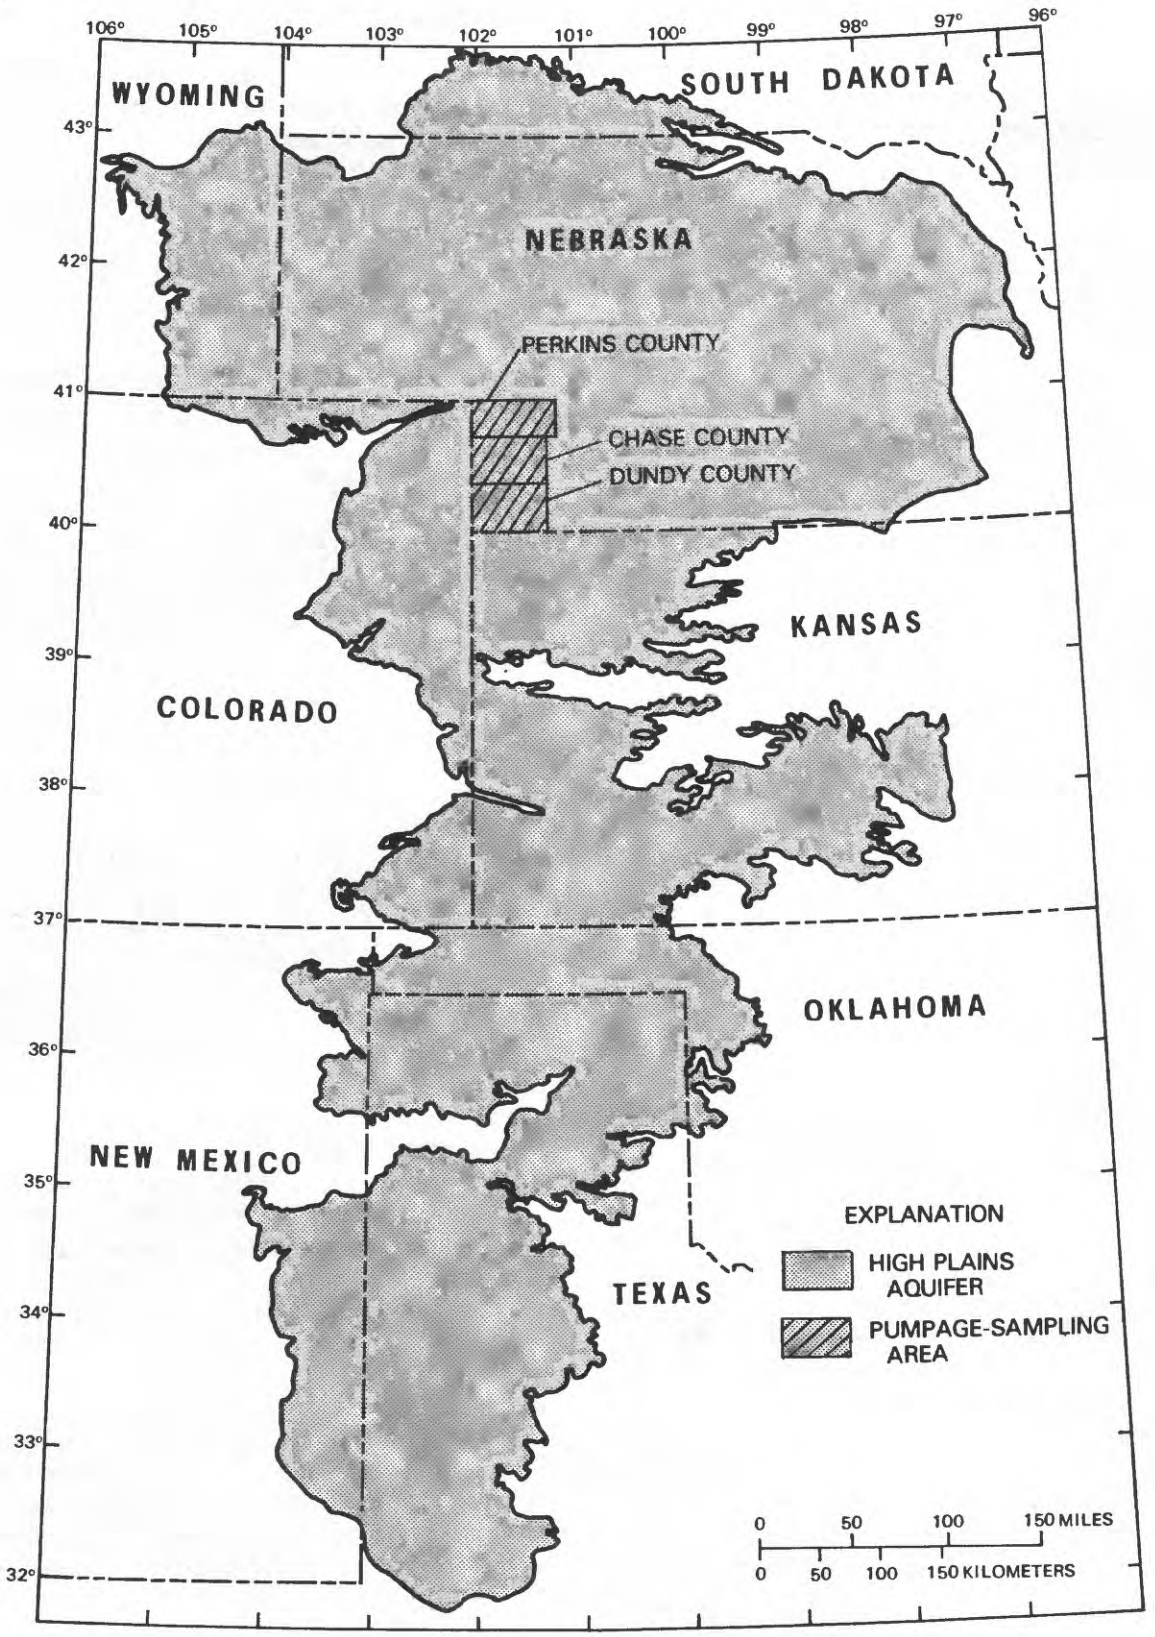

Figure 1.—Location of pumpage-sampling area.

Purpose and Scope

The U.S. Geological Survey High Plains Regional Aquifer System-Analysis Project is conducting a study to better define the relationship between pumpage for irrigation and return flow from all applied water (irrigation plus precipitation) in the three-county area so future water-level changes can be more accurately predicted. Normal total precipitation from April through October in the Southwest Nebraska Division is 15.94 in. (National Climatic Data Center, 1983). During this period in 1984, total precipitation was 0.33 in. more than the normal. This surplus was due to greater than average precipitation in October.

The study also will compare measurements made using a Clampitron[1] portable flowmeter with measurements from inline flowmeters to determine discharge from individual irrigation systems. The three-county area in southwestern Nebraska was chosen for this study because it has been designated by the Nebraska Department of Water Resources as a ground-water control area and all irrigation systems in this area are required to have an approved inline flowmeter installed. Therefore, comparisons can be made between the portable flowmeter and inline flowmeters to determine the consistency of measurements from these meters. To meet these objectives, the U.S. Geological Survey collected data on irrigation wells, crops, acreage irrigated, and pumpage for irrigation during 1983 and 1984. The data for 1984 are presented in this report. The data for 1983 are presented by Stephens and others (1984).

Acknowledgments

Collection of data for this report relied on the cooperation of the Upper Republican Natural Resources District, the U.S. Department of Agriculture, Agricultural Stabilization and Conservation Service, and Soil Conservation Service, and numerous irrigators whom allowed us access to their irrigation systems. Without their cooperation, this study could not have been conducted.

METHODS OF STUDY

The data presented in this report (tables 1A-4C) were collected during 1984. Data were collected at 57 randomly selected wells (fig. 2). Of these wells, 27 are in Chase County, 17 are in Dundy County, and 13 are in Perkins County. The wells were visited prior to the 1984 irrigation season to obtain site location and initial readings from the inline flowmeters and energy (electric or natural gas) meters. The wells were visited periodically during the summer to obtain data on crops, discharge, time of operation, and water application for the irrigation wells. Discharge measurements were made using the Clampitron portable flowmeter when possible. When it was not possible to use the Clampitron portable flowmeter, discharge measurements were made using standard methods, for example, using a pygmy meter in open-ditch flood-irrigation systems. Discharge also was measured using the inline flowmeter installed on the irrigation well. Volumetric inline flowmeters and energy meters also were used to estimate the time of operation of the irrigation well.

IRRIGATION DATA

Explanation of Terms for Tables 1A-1C

TABLE 1A-1C--CROP AND WELL DATA

Well location
Local numbering system used for tables 1A-1C; see figure 3

Map number
Number corresponding to location of wells monitored during the 1984 growing season; see figure 2

Well identifier
The "well identifier" is a 15-digit number generated from the original latitude and longitude of the well location in degrees, minutes, and seconds with a 2-digit sequence code at the end to locate multiple wells within a 1-second area. The well identifier is unique for each well and is not changed once it has been entered into the U.S. Geological Survey's computer files.

Irrigated-crop data
Type --Type of crop(s) irrigated at the site
System--Type of irrigation system used:
- Pivot = Center pivot
- Flood = Ditch or gated pipe
- Sprinkler = Sprinklers other than center pivot

Acres --Acreage of crop(s) irrigated at the site
Source--Source of acreage information:
- ASCS = Agricultural Stabilization and Conservation Service of U.S. Department of Agriculture
- Est. = Estimated
- Meas. = Measured

Well data
Depth --Depth of well, in feet below land surface
Discharge pipe diameter--Diameter of discharge pipe, in inches
Pump horsepower --Rated pump-motor horsepower from motor plate
Power
- Source --Pump power source:
  - Elec. = Electric motor
  - N. gas = Natural-gas engine
  - Diesel = Diesel engine
  - LP gas = Liquid-propane engine
- Rating--
  - Electrical meter = Instantaneous kilowatt demand, in kilowatts
  - Natural gas meter = Instantaneous natural gas demand, in cubic feet per minute

Explanation of Terms for Tables 3A-3C

TABLE 3A-3C--TIME OF OPERATION

Well Location
Local numbering system used for tables 3A-3C; see figure 3

Map number
Number corresponding to location of wells monitored during the 1984 growing season; see figure 2

Date
Begin --Beginning date of time-of-operation measurement
End --Ending date of time-of-operation measurement

Inline flowmeter time--Time computed from inline flowmeter, in hours

Energy meter
Type --Elec. = Electric meter
--N. gas = Natural-gas meter
Time --Time computed from energy meter, in hours

Other --Time from other sources, if applicable
Source --Source of other time of operation data
Time --Time computed from other source, in hours

Remarks --McCrometer, Water Specialties, and Sparling; are brands of inline flowmeters

Table 3A.—Time-of-operation data for irrigation wells in Chase County

Explanation of Terms for Tables 4A-4C

TABLE 4A-4C--WATER APPLIED

Well Location
Local numbering system used for tables 4A-4C; see figure 3

Map number
Number corresponding to location of wells monitored during the 1984 growing season; see figure 2

Pumpage

Inline —Acre-feet of water pumped; measured by the inline flowmeter

Sampling —Acre-feet of water pumped; calculated by multiplying average Clampitron discharge by total hours of operation computed using the energy meter or other source (inline flowmeter used for time of operation if no other source available)

Irrigated acres—Acreage of irrigated crop

Water applied

Inline —Inches of water applied to crop; calculated by multiplying pumpage (acre-feet) from inline flowmeter by 12 (to convert feet to inches) and dividing by acreage of crop

Sampling —Inches of water applied to crop; calculated by multiplying pumpage (acre-feet) from sampling by 12 (to convert feet to inches) and dividing by acreage of crop

Table 4A.—Summary of water applied to crops in Chase County

Well location	Map number from figure 2	Crop type	System type	Pumpage (acre-feet)		Irrigated acres	Water applied (inches)		Remarks
				Inline	Sampling		Inline	Sampling	
SB-05-38-08-DB	1	Beans	Pivot	150.8	126.1	125.2	14.4	12.1	Some water on wheat
SB-05-39-03-CC	2	Barley	Pivot	—	—	129.3	—	—	Crop destroyed, no pumpage data
SB-05-39-04-BA	3	Corn	Pivot	181.0	174.9	133.5	16.3	15.7	--
SB-05-39-21-B	4	Corn Beans	Pivot	162.1	154.4	127.0	15.3	14.6	--
SB-05-39-22-B	5	Wheat	Pivot	—	—	130.0	—	—	No data for wheat
