WATER-QUALITY DATA FOR 34 SITES, APRIL AND JUNE 1984, NEAR THE Y-12 PLANT, THE OAK RIDGE RESERVATION, TENNESSEE

Pamela J. Pulliam

ABSTRACT

Water-quality data were collected at 34 sites in the vicinity of the Y-12 Plant, Oak Ridge, Tennessee, on April 12 and 13, 1984. Concentrations of dissolved major and trace constituents were determined; field determinations of specific conductance, pH, temperature, alkalinity, and dissolved oxygen were made. Gross alpha and beta activity were determined for 10 of the 34 sites sampled in April, and concentrations of dissolved organic carbon and oil and grease were determined for 11 sites sampled on June 3, 1984.

INTRODUCTION

Water-quality data were collected on April 12 and 13, 1984, during high base flow by the U.S. Geological Survey in watersheds near the Y-12 Plant at the Oak Ridge Reservation, Tenn. (fig. 1). The watersheds range in size from 0.33 to 5.92 mi^2. Concentrations of dissolved major and trace constituents were determined; field determinations of specific conductance, pH, temperature, alkalinity, and dissolved oxygen were made. This data collection is part of a study done in cooperation with the Department of Energy. The purpose of the study is to describe the regional ground-water flow system and to determine the extent of any effects on ground-water quality resulting from activities at the Y-12 Plant.

The major sources of contamination in the vicinity of the Y-12 Plant are the S-3 ponds, located at the headwaters of Bear Creek at the eastern end of the valley, and the Bear Creek burial grounds and oil landfarm, located north of Bear Creek, southwest of the S-3 ponds (fig. 2). Because a significant part of the flow in the streams is comprised of ground water, determining the quality of water from these streams may indicate the extent of ground-water contamination and the direction of regional ground-water flow.

Figure 2.--Sampling sites.

DESCRIPTION OF THE AREA

The Oak Ridge Reservation includes 58,000 acres in the west-central part of East Tennessee, and is bounded on the northeast, southeast, and southwest by the Clinch River, and on the northwest by Blackoak Ridge (McMaster, 1967, p. N2). The three major facilities in the area are X-10, the Oak Ridge National Laboratory (ORNL), a research and development center; Y-12, a research, development, and production center; and K-25, the Gaseous Diffusion Plant (ORGDP), a production facility (fig. 1).

The Oak Ridge Reservation is in the Valley and Ridge physiographic province (Miller, 1974). Ordovician and Cambrian rocks that underlie the Valley and Ridge are predominately carbonate, siltstone, shale, and some sandstone.

The water-quality data were collected at sites on Pine and Chestnut Ridges, and in Bethel and Bear Creek Valleys. Pine Ridge, underlain by the sandstone and shale of the Rome Formation, and Chestnut Ridge, underlain by the siliceous dolomite of the Knox Group, are northeast-trending at altitudes of 1,000 to 2,000 feet. Bear Creek and Bethel Valleys are generally flat at altitudes of 750 to 850 feet and are underlain by shale of the Conasauga Group and by limestone and shale of the Chickamauga Group, respectively.

APPROACH

The 34 water-quality sites were selected based upon the specific conductance and discharge values obtained for 18 watersheds during the period February 15 through April 9, 1984 (Evaldi, 1984). Locations and identification numbers of the sites are shown on figure 2. The whole number part of the site number indicates the watershed in which the site is located, and the decimal part is a sequential number within the watershed. The sites were chosen to satisfy two purposes: (1) to collect background water-quality data to represent the various rock types, and (2) to identify locations of contaminated groundwater input to surface water.

The headwaters of watersheds 1, 2, 3, and 5 and the lower reach of 7 drain the Knox Group, the downstream reaches of 1, 2, 3, and 5 drain the Chickamauga Group. The headwaters of 7, and watersheds 8, 9, 11, and 18, drain the Conasauga Group. The headwaters of watershed 14 drain the Rome Formation and the lower stream reach drains the Conasauga Group.

Site numbers, Oak Ridge (S16A grid) coordinates, latitudes, longitudes, and downstream order numbers are listed in table 1. The purpose of sampling a particular site and the rock unit affecting the site are also listed.

EXPLANATION OF DATA

A listing of the water-quality parameters collected in the vicinity of the Y-12 facility is shown in table 2. The samples collected on April 12 and 13 were analyzed for all the listed parameters with the exception of dissolved organic carbon and oil and grease, which were obtained on June 3, 1984.

Table 2.--Water-quality parameters determined

Field:	
Water temperature	Alkalinity
Specific conductance	Dissolved oxygen
pH	
Laboratory:	
Major constituents (dissolved) or properties:	
Calcium	Chloride
Magnesium	Sulfate
Sodium	Nitrogen
Potassium	Phosphorus
Alkalinity	Residue on evaporation
Trace constituents (total recoverable) and compounds:	
Barium	Copper, Lithium, Strontium
Beryllium	Cyanide, Manganese, Uranium
Cadmium	Iron, Mercury, Vanadium
Chromium	Lead, Molybdenum, Zinc
Cobalt	
Other parameters:	
Gross alpha (dissolved and suspended)	
Gross beta (dissolved, total, and suspended)	
Dissolved and total organic carbon	
Oil and grease	

Field Analyses: Measurements of temperature, specific conductance, pH, dissolved oxygen, alkalinity, and streamflow were made at each site at the time of sample collection (table 3). In some cases insufficient flow prevented measurement of discharge and (or) dissolved oxygen. Temperature, specific conductance, and discharge were determined on June 3.

Table 3.--Field analyses

Site number	Date	Temperature (° C)	Specific conductance (µS/cm)	pH	Alkalinity field (mg/L as $CaCO_3$)	Oxygen, dissolved (mg/L)	Discharge instantaneous (ft^3/s)

Laboratory Analyses: The water-quality data collected during April and June are listed in table 4. Samples were filtered through a 0.45 micrometer membrane filter at the time of collection. Trace constituent and oil and grease concentrations were determined from unfiltered samples (table 5). These analyses were done by the U.S. Geological Survey Central Laboratory, Doraville, Georgia, using methods described in Skougstad and others (1979) and Goerlitz and Brown (1972). The radionuclides (table 6) were determined at the Geological Survey Central Laboratory in Denver, Colorado, using methods described in Thacker and others (1977).
