GROUND-WATER LEVELS, 1980, SNAKE RIVER PLAIN, IDAHO AND EASTERN OREGON

Compiled by M. D. Bassick

ABSTRACT

Well inventory and ground-water level data for 1,562 sites were collected on and near the Snake River Plain in the spring and summer of 1980 as part of the U.S. Geological Survey's RASA (Regional Aquifer-System Analysis) program. The data supplement a report that describes the configuration of the water table, depth to water, water-level fluctuations, and water movement in the Snake River Plain regional aquifer system.

INTRODUCTION

The Snake River Plain is one of 28 regional ground-water systems selected for study by the U.S. Geological Survey in their RASA (Regional Aquifer-System Analysis) program. Well inventory and ground-water level data were collected for 1,562 wells on and near the Snake River Plain in the spring of 1980. Measurements in about 850 wells were repeated in August 1980 to determine effects of ground-water withdrawals on water levels.

Water-level data for about 1,200 wells were used to construct a water-table map (fig. 1) and calibrate ground-water flow models of eastern and western parts of the plain.

This report lists depth to water, water-level altitudes, geohydrologic, and physical data for each well measured. The data are sorted alphabetically by county and by the Idaho well-numbering system. Water-level altitudes for wells that were not completed in the regional aquifer and not used as map controls or that were outside the boundary of the Snake River Plain are marked with an asterisk in table 1.

The purpose of this report is to supplement a separate report (Lindholm and others, U.S. Geological Survey, written commun., 1985) that describes the configuration of the water table, depth to water, water-level fluctuations, and water movement in the Snake River Plain regional aquifer system.

Nomenclature used in table 1 is based on that in the U.S. Geological Survey's Ground-Water Site Inventory data base. Some modifications made for clarity are explained in the abbreviations. Data are stored on an Amdahl[1] computer at the U.S. Geological Survey Computer Center in Reston, Va., and can be accessed by System 2000 commands.

WELL-NUMBERING SYSTEM

The well-numbering system used by the U.S. Geological Survey in Idaho indicates the location of wells within the official rectangular subdivision of the public lands, with reference to the Boise base line and meridian. The first two segments of the number designate the township and range.

[1] Use of trade names in this report is for identification purposes only and does not constitute endorsement by the U.S. Geological Survey.

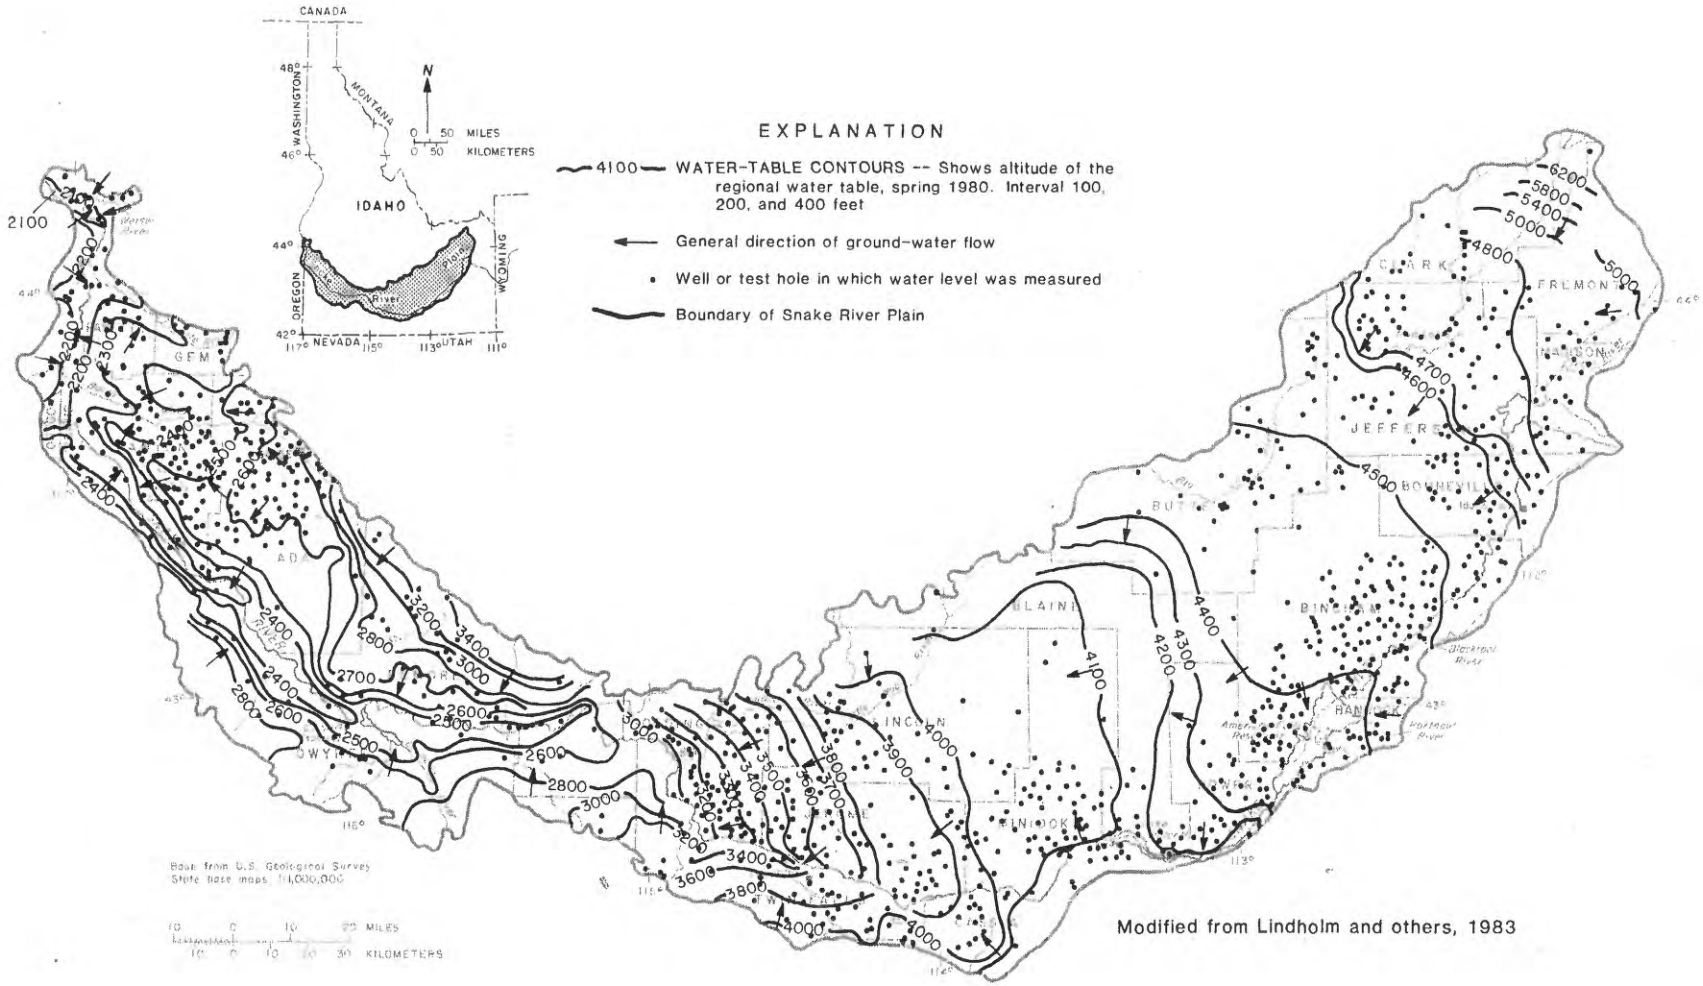

Figure 1.--Configuration of the water table, spring 1980.

The third segment gives the section number; three letters, which indicate the ¼ section (160-acre tract), ¼-¼ section (40-acre tract), and ¼-¼-¼ section (10-acre tract); and serial number of the well within the tract. Quarter sections are lettered A, B, C, and D in counterclockwise order from the northeast quarter of each section (fig. 2). Within quarter sections, 40-acre and 10-acre tracts are lettered in the same manner. Well 8S-24E-31DAC1 is in the SW¼NE¼SE¼, sec. 31, T. 8 S., R. 24 E., and is the first well inventoried in that tract. The well-numbering system in Oregon is referenced to the Willamette base line and meridian.

In addition, a unique identification number is assigned to each well. This number is based on the well's location with respect to latitude and longitude. For example, the number 424053113412801 indicates well 8S-24E-31DAC1 is at latitude 42°40'53" and longitude 113°41'28". The sequential ending number (01, etc.) allows for additional wells at the same general location.
