DISCUSSION

The hydrograph data indicates that the water level fluctuations are primarily driven by seasonal variations and storm events. The model predictions accurately capture these fluctuations, demonstrating the model's capability to simulate real-world conditions. The data also suggests that the channel's hydrodynamics are influenced by the surrounding topography and bathymetry.

ACKNOWLEDGEMENTS

The authors would like to acknowledge the support of the U.S. Army Corps of Engineers for funding this study. We also thank the data collectors for their efforts in acquiring the hydrograph data.
