

EXPLANATION MAP C

- All contacts are inferred except at profile crossings.
- Scarp, hatchures on down side
- Fault, ball on down side; queried where doubtful; strike inferred; exclusive of lower-slope unit
- Upslope (detachment) side of mass movement
- Slide or slump toe
- Rubble along profile; pattern shows inferred areal extent
- Filled channel in foreset unit
- Fracture; strike inferred, exclusive of lower-slope unit
- Approximate margin of eroded upper slope
- Inner edge of shelf facet
- Buried antiform
- Buried synform
- C1-C1- Bench below which upper-slope unit is exposed
- C2-C2- Bench marks top (?) of rugged lower slope, inferred outcrop of lower-slope unit
- Approximate updip margin of layered rise unit; hatchures indicate cuesta
- Contacts between updip margin of layered rise unit and inferred base of upper-slope unit (C2---C2) are connected on assumption of stratigraphic continuity
- Irregular surface caused by intraformational deformation
- Trackline, Iselin (1)7-78-2 (1978)
- Trackline, Gilliss (G)7903-03 (1979)
- Cross-tics indicate hour intervals (numbers keyed to seismic profiles). Large numbers indicate beginnings and ends of numbered profiles.
- Ramp foot; toe of surficial layer

SCALE 1:250,000
