CONVERSION FACTORS

The following factors can be used to convert inch-pound units in this report to the International System (SI) of units.

<u>Multiply inch-pound unit</u>	<u>By</u>	<u>To obtain SI unit</u>
acre	4,047	square meter
foot	0.3048	meter
inch (in.)	25.40	millimeter
mile	1.609	kilometer

National Geodetic Vertical Datum of 1929 (NGVD of 1929): A geodetic datum derived from a general adjustment of the first-order level nets of both the United States and Canada, formerly called "Mean Sea Level."

RECORDS OF WELLS AND WATER-LEVEL FLUCTUATIONS FROM THE STATEWIDE

OBSERVATION-WELL NETWORK IN MONTANA THROUGH 1985

by

Michelle F. Johnston and Kent A. Dodge

ABSTRACT

The statewide observation-well network of the U.S. Geological Survey was developed in Montana in 1947 to record long-term fluctuations of water levels in selected wells. This report was prepared to summarize well records and water levels for the network and to show the location of the wells. Data for 299 wells are tabulated in this report, generally within the interval 1947-85. The well records include altitude of land surface, date drilled, well depth, use of site, use of water, casing type, casing size, casing depth, top and bottom of perforations, principal aquifer, year water-level measurements began and measurement frequency, year chemical analysis began, type of analysis, analyzing agency, and types of logs available. The water-level data include date of measurement and depth to water below land surface. Well location is shown on a map at a scale of 1:1,000,000.

INTRODUCTION

Systematic collection of data from selected observation wells is a continuing program of the U.S. Geological Survey in Montana. The purpose of this report is to summarize the data obtained from the statewide observation-well network and to show the approximate location of the wells. The data consist of well records and water-level measurements from 299 wells throughout Montana that were part of the network in 1985. This report was prepared in cooperation with the U.S. Bureau of Land Management, the Montana Bureau of Mines and Geology, and the Montana Department of Natural Resources and Conservation.

WELL-NUMBERING SYSTEM

Each well is numbered according to geographic position within the rectangular grid system used by the U.S. Bureau of Land Management (fig. 1). The number consists of as many as 14 characters. The first three characters specify the township and its position north (N) or south (S) of the Montana Base Line. The next three characters specify the range and its position west (W) or east (E) of the Montana Principal Meridian. The next two characters are the section number. The next one to four characters designate the quarter section (160-acre tract), quarter-quarter section (40-acre tract), quarter-quarter-quarter section (10-acre tract), and quarter-quarter-quarter-quarter section (2.5-acre tract), respectively, in which the well is located. The subdivisions of the section are designated A, B, C, and D in a counterclockwise direction, beginning in the northeast quadrant. The last two digits form a sequence number based on the order of inventory of wells in the same 2.5-acre tract. For example, as shown in figure 1, well 01N25E36CBDA01 is the first well inventoried in the NE1/4SE1/4NW1/4SW1/4 sec. 36, T. 1 N., R. 25 E.

Figure 1.--Well-numbering system.

Well locations were plotted according to this well-numbering system on a map at a scale of 1:1,000,000 (pl. 1). Areal distribution of the wells is determined by hydrologic conditions, area of interest, well owner permission, accessibility, and budgetary constraints.

GROUND-WATER OCCURRENCE

The origin of most of the ground water in Montana is precipitation, which varies significantly across the State. Much of the precipitation on the land surface returns to the atmosphere by evaporation or plant transpiration, or flows overland. Part of overland flow seeps into the soil and percolates into the underlying rocks. In these rocks, water can occur in voids, interstices, joints, fractures, or solution channels. Occurrence of ground water is determined by the size, shape, and distribution of the openings. Openings that are interconnected function as minute channels through which the water slowly moves until it is discharged to the Earth's surface through springs, wells, and gaining streams, or to the atmosphere by evaporation and plant transpiration. Under typical conditions, over a long time, the amount of water that is added to ground-water storage is equal to the amount that is discharged.

An aquifer is a geologic formation that transmits water in sufficient quantity to supply pumping or flowing wells or springs. Most of the wells drilled into one or more of the numerous aquifers produce water. In some areas of Montana, ground water is relatively difficult to obtain, and aquifers yielding only a few gallons of water per minute are important sources of water. In other areas, where aquifers can yield several hundred gallons per minute to wells, formations yielding only a few gallons per minute may be classed as nonproductive.

Aquifers are characterized as water table or artesian. A water-table aquifer is unconfined, is generally exposed at the surface, and contains a saturated zone and an unsaturated zone. The surface within the saturated zone at which the pressure is atmospheric is known as the water table. The water level in wells completed in an unconfined aquifer coincides with the water table. An artesian aquifer is overlain by a relatively impermeable confining layer and contains water under sufficient pressure to rise above the top of the aquifer if penetrated by a well. If the pressure is sufficient to raise the water above the land surface, the well will flow. (See Reed and McMurtrey, 1970, p. 2-3.)

DEVELOPMENT OF THE OBSERVATION-WELL NETWORK

Background

The systematic measurement of ground-water levels in Montana was started in 1947 under a Federal program begun in 1942 to develop a nationwide observation-well network. Prior to 1947, water levels in Montana were measured in project observation wells established during each areal study. In 1964 the State Engineer's office allocated funds to expand the network. In 1965 the observation-well network was made a part of the cooperative ground-water program with the Montana Bureau of Mines and Geology.

Prior to 1956, water-level measurements were published annually in water-supply papers by the U.S. Geological Survey. From 1956-74 the records of water levels in the observation-well network were published at 5-year intervals. Water-supply papers that contain measurements of water levels in observation wells in the Federal network in Montana are shown on the following page:

Year	Water-Supply Paper	Year	Water-Supply Paper	Year	Water-Supply Paper	Year	Water-Supply Paper
1935	777	1941	940	1950	1169	1956-60	1760
1936	817	1943	990	1951	1195	1961-65	1845
1937	840	1944	1020	1952	1225	1966-70	1980
1938	845	1947	1100	1953	1269	1971-74	2161
1939	886	1948	1130	1954	1325		
1940	910	1949	1160	1955	1408		

Subsequent selected measurements in the network have been published in annual water-data reports (U.S. Geological Survey, 1976-85). Reports for network data collected through 1966, 1967, 1968, and 1969 were published by the Montana Bureau of Mines and Geology (McMurtrey and Reed, 1967, 1968; Reed and McMurtrey, 1969, 1970). Network data collected after 1969 have not been published collectively, and many sites have been added to or deleted from the network during this interval.

Potential Use of the Data Record

The statewide observation-well network was developed to record long-term fluctuations of water levels in selected wells throughout Montana. Various uses of such records could be: (1) To predict trends in ground-water levels and, thereby, forecast fluctuations in storage; (2) to serve as a framework to which shorter records from project studies may be compared; (3) to assist in the prediction of base flow of streams; (4) to evaluate the relationship between water-level fluctuations and precipitation, pumping, or other factors; (5) to identify areas with detrimentally low or high ground-water levels; and (6) to provide information for research. The intended use of the data will determine the frequency of water-level measurements needed. (See Reed and McMurtrey, 1970, p. 1.)

RECORDS OF WELLS

Water from most wells in the observation-well network is used for domestic, stock, irrigation, public-supply, or industrial purposes. Some is used for recreation, fire purposes, or is unused. The records of wells in this report include the most significant data obtained during an onsite inventory; much of the data pertains to well construction.

Well data are listed by local number, in order from north to south across the State and within this order from west to east. Each well location is shown on plate 1.

The principal aquifer is identified for each well. The geologic units penetrated by wells in the network range in age from Precambrian to Holocene; most units are Cretaceous or younger. Correlation of the stratigraphic sequence for various parts of Montana is given in table 1.

The records of wells (table 2) and the water-level measurements (table 3) were retrieved from the National Water Data Storage and Retrieval System (WATSTORE). WATSTORE, which was established in 1971, serves as a central repository of the

various types of water data collected by the Geological Survey and provides an effective and efficient means of releasing water data to the public. Information about the availability of specific types of water data, such as the chemical analyses and logs identified in table 2, can be obtained from the District Chief, U.S. Geological Survey, 428 Federal Building, 301 South Park, Drawer 10076, Helena, MT 59626-0076.

WATER-LEVEL FLUCTUATIONS

Water-level measurements for wells in the observation-well network are listed in table 3. In general, the data are within the interval 1947-85, although the water-level record for well 23N24W34ADAA01 includes a few measurements for 1943. The interval of measurement is not necessarily consistent; therefore, measurements are not available for all years. Even though water levels were not measured in some wells during 1985, the wells are still part of the observation-well network.

The data indicate that water levels in wells are constantly fluctuating and may rise or fall a fraction of an inch or many feet in a relatively short time. Factors that can affect water levels include changes in rate of recharge and discharge, local geology, local irrigation, precipitation, pumping from nearby wells, evaporation, transpiration, and changes in water levels of nearby lakes, streams, or drains. Occasionally, water levels can be affected by earthquakes, earth tides, changes in atmospheric pressure, and changes in loading of the Earth's surface. (See Reed and McMurtrey, 1970, p. 10.)

Seasonal fluctuations in a typical well are illustrated in figure 2. The water level generally declines in the autumn and winter, and rises in the spring and summer. Seasonal fluctuations in well 06N20W19CCCC02 result in a change in water level of about 10 to 12 feet per year. In other areas or other aquifers, seasonal fluctuations can be significantly different. In areas of large withdrawal for irrigation use, for example, the lowest annual water level may occur near the end of the irrigation season. Regional aquifers distant from recharge areas and not subjected to stress from withdrawal may experience little or no annual fluctuation in water levels.

Long-term monitoring of water levels can help water managers understand the ground-water resource and its response to natural conditions and the effects of human activities. Long-term trends reflect changes in storage as a result of natural climatic variations or induced variations such as a change in irrigation pattern, land drainage, or pumping from wells (Reed and McMurtrey, 1970). The hydrograph for well 32N15E17DDDC01 (fig. 3) is one of the longest water-level records in the observation-well network. The hydrograph shows that since the well was completed in 1947 the general trend has been a rising water level.

DATA

Table 2.--Records of wells

Local number--numbering system described in text.
 Site identification--15-digit identification number, based on latitude-longitude location.
 Altitude of land surface--reported in feet above National Geodetic Vertical Datum of 1929.
 Date drilled--date well first constructed.
 Well depth--reported in feet below land surface.
 Use of site--O, observation; T, test; U, unused; W, withdrawal.
 Use of water--F, fire; H, domestic; I, irrigation; N, industrial; P, public supply; R, recreation; S, stock; U, unused.
 Type of casing--C, concrete; G, galvanized iron; P, plastic; R, rock or stone; S, steel.
 Size (diameter) of casing--reported in inches.
 Depth of bottom of casing--reported in feet below land surface.
 Top of perforations--reported in feet below land surface.
 Bottom of perforations--reported in feet below land surface.
 Principal aquifer--the following codes for the principal aquifers are those used in the National Water Data Storage and Retrieval System and some may not follow current usage of the U.S. Geological Survey:

110ALVM - Alluvium, Quaternary
 111ALVM - Alluvium, Holocene
 111SPBK - Spoil banks
 112ALVM - Alluvium, Pleistocene
 112DRFT - Glacial drift
 112GCLO - Glacial outwash
 112GLCC - Glaciolacustrine deposits
 112OTSH - Outwash
 112TILL - Glacial till
 112TRRC - Terrace deposits
 120PLNC - Plutonic rocks
 120SDMS - Sediments
 120TRTR - Tertiary System
 121FLXV - Flaxville Formation
 125FRUN - Fort Union Formation
 125LEBO - Lebo Shale Member of Fort Union Formation
 125GRV - Tongue River Member of Fort Union Formation
 125TLCK - Tullock Member of Fort Union Formation
 210CRCS - Cretaceous System
 211EGLE - Eagle Sandstone
 211FHHC - Fox Hills-lower Hell Creek aquifer
 211FXHL - Fox Hills Sandstone
 211HLCK - Hell Creek Formation
 211JDRV - Judith River Formation of Montana Group
 211PRKM - Parkman Sandstone of Montana Group
 211TMDC - Two Medicine Formation of Montana Group
 211VRGL - Virgelle Sandstone Member of Eagle Sandstone
 217FCK - First Cat Creek sandstone of Colorado Group
 217FLOD - Flood Member of Blackleaf Formation
 217KOTN - Kootenai Formation
 217SCCK - Second Cat Creek sandstone of Kootenai Formation

Table 2.--Records of wells--Continued

217TCKK - Third Cat Creek sandstone of Kootenai Formation
221SWFT - Swift Formation of Ellis Group
331MDSN - Madison Group
331MSNC - Mission Canyon Limestone

Begin year water level--year water-level measurements began.

Measurement frequency--A, annual; C, continuous recorder; M, monthly; Q, quarterly;
S, semi-annual; Z, other.

Begin year chemical analysis--year well first sampled for chemical analysis.

Type of chemical analysis--A, field parameters; B, common ions; C, trace elements.

Laboratory--MBMG, Montana Bureau of Mines and Geology, Butte, Montana; MSBH, Montana
State Board of Health; PRI, private laboratory; USGS, U.S. Geological Survey,
Denver, Colorado.

Logs--C, caliper; D, driller; E, electric; G, geologist; H, magnetic; I, induction;
J, gamma ray; L, laterolog; N, neutron; T, temperature; U, gamma-gamma.

Table 3.--Water-level measurements

[Water level--in feet below or above (+) land surface. MS, conditions of measurement. First column (M) is method of measurement--B, analog; E, estimated; G, pressure gage; H, calibrated pressure gage; M, manometer; R, reported; S, steel tape; T, electric tape; Z, other. Second column (S) is site status--D, dry; E, recently flowing; F, flowing; O, obstruction; P, pumping; R, recently pumped; S, nearby pumping; T, nearby recently pumped; W, well destroyed; X, surface water effects; Z, other]
