CONVERSION FACTORS

For use of readers who prefer to use metric units, conversion factors for terms used in this report are listed below:

<u>Multiply</u>	<u>By</u>	<u>To obtain</u>
foot (ft)	0.3048	meter (m)
mile (mi)	1.609	kilometer (km)

Sea level: In this report "sea level" refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)--a geodetic datum derived from a general adjustment of the first-order level nets of both the United States and Canada, formerly called "Mean Sea Level of 1929."

GROUND-WATER LEVELS IN ARKANSAS, SPRING 1987

By David A. Freiwald and Maria Plafcan

ABSTRACT

Ground-water level measurements were made in 701 observation wells in Arkansas in the spring of 1987. This report contains the water-level data presented in tables listed by aquifer; then by county. For each well, the depth to water below land surface and the altitude of the water level for 1987 are shown, along with the net change in water level between 1986 and 1987 and between 1982 and 1987. In addition, the report contains maps showing the average water-level changes, by county, between the years 1982 and 1987 for the aquifers in the Quaternary deposits and the Sparta and Memphis Sands. Also shown are water-level hydrographs for selected wells completed in the Quaternary deposits and Sparta Sand.

The aquifers in the Quaternary deposits and the Sparta and Memphis Sands are important aquifers in eastern and southern Arkansas for agricultural, municipal, and industrial use. Water-level data contained in this report showed an average water-level decline of 0.03 foot in the Quaternary deposits of the 24 most heavily irrigated counties of eastern Arkansas and 0.39 foot in the Sparta and Memphis Sands between the years 1982 and 1987.

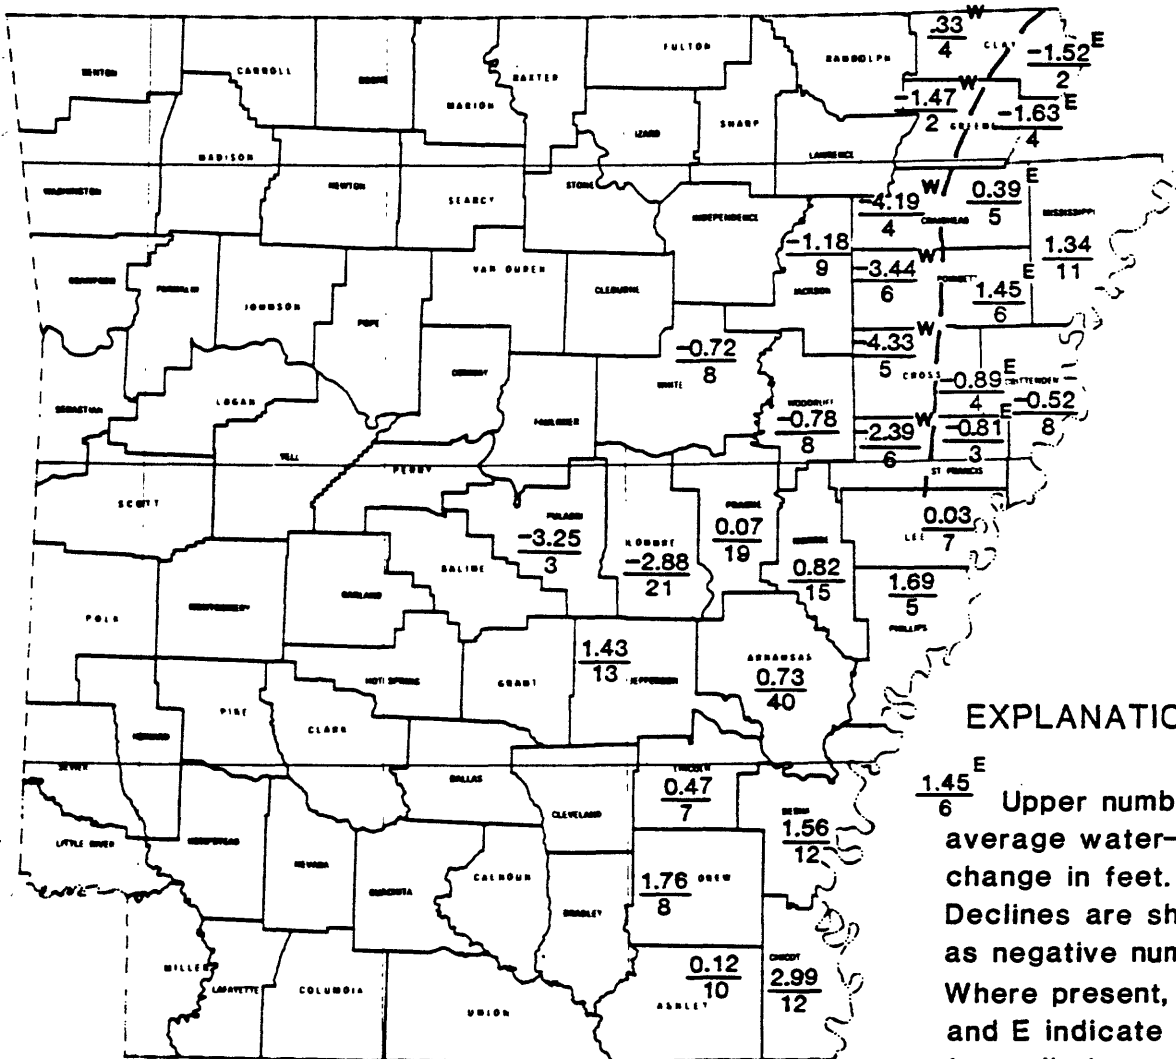

INTRODUCTION

This report contains records of water-level measurements from wells in Arkansas that compose the Statewide observation-well network maintained by the U.S. Geological Survey in cooperation with the Arkansas Geological Commission. The observation-well network is designed to provide data for evaluation of the regional trend of water-level changes in each of the principal water-bearing formations or aquifers that are tapped by wells in the State.

The water-level measurements made in the 701 wells listed in this report were made during March and April 1987. The water-level data are shown in tables 1-16 and are listed by aquifer, then by county. For additional information on the hydrologic properties of the aquifers, the reader is referred to the reports listed in the selected references section of this report.

The aquifers in the Quaternary deposits and the Sparta and Memphis Sands are the most heavily used aquifers in Arkansas (Holland and Ludwig, 1981). Average water-level changes between the years 1982 and 1987 were computed from the water-level data contained in this report for these two aquifers.

Water levels from 289 wells measured in the Quaternary deposits in the 24 heavily irrigated counties of eastern Arkansas averaged a decline of 0.03 foot between 1982 and 1987. The largest declines occurred in Craighead, Poinsett, Cross, and St. Francis Counties in the areas west of Crowleys Ridge and in Pulaski and Lonoke Counties (fig. 1). In general, the counties in northeastern Arkansas showed an average decline in ground-water levels, whereas the counties in southeastern Arkansas showed an average rise in levels.

EXPLANATION

$\frac{1.45}{6}^E$ Upper number is average water-level change in feet. Declines are shown as negative numbers. Where present, W and E indicate data for wells located west and east of Crowleys Ridge, respectively. Lower number is number of wells used to calculate the average.

--- Approximate location of Crowleys Ridge.

Figure 1.--Average water-level changes by county between 1982 and 1987 of wells completed in the Quaternary deposits in eastern Arkansas.

North of about 35° latitude, the Sparta Sand becomes the upper part of the Memphis Sand (Hosman and others, 1968). Because the water levels in the Sparta aquifer are correlative with those in the Memphis aquifer in Arkansas, the water-level data are often grouped together. Water levels measured in 183 wells completed in the Sparta and Memphis Sands of eastern Arkansas declined an average of 0.39 foot between 1982 and 1987. Only 8 of the 25 counties which had data from the aquifer in the Sparta and Memphis Sands in this report showed an average rise in ground-water levels between 1982 and 1987. Figure 2 shows the average ground-water level changes by county for the aquifer in the Sparta and Memphis Sands.

Water-level hydrographs of wells show long-term trends in ground-water conditions. Figures 3 and 4 are water-level hydrographs for selected wells completed in the Quaternary deposits and the Sparta Sand.

DESCRIPTION OF TABLES

Headings in tables 1-16 are defined as follows:

Well number: Township, range, and section number designation of well.

Altitude of land surface: Altitude of the land surface at the well referenced to sea level.

Depth to water below land surface: Measured depth to water, in feet below land surface. A plus (+) preceding the depth-to-water value indicates the water level is above land surface.

Altitude of water level: Altitude of water level above or below (-) sea level, rounded to the nearest foot.

Net change in water level: Difference between 1986 and 1987 depth-to-water measurements and difference between 1982 and 1987 measurements. Symbol preceding number indicates a decline (-) or a rise (+) in water levels in the well.

Remarks: Where water-level data are not available for the 5-year interval, the time interval for the net-change value is indicated here.

WELL-NUMBERING SYSTEM

The well-numbering system used in this report is based upon the location of the wells according to the Federal land survey used in Arkansas. The component parts of a well number are the township number, the range number, the section number, and three letters which indicate, respectively, the quarter section, the quarter-quarter section, and the quarter-quarter-quarter section in which the well is located. The letters are assigned counterclockwise, beginning with "A" in the northeast quarter or quarter-quarter or quarter-quarter-quarter section in which the well is located. For example, well 01S03W04BBD16 (fig. 5) is located in Township 1 South, Range 3 West, and in the southeast quarter of the northwest quarter of the northwest quarter of section 4. This well is the 16th well in this quarter-quarter-quarter section of section 4 from which data were collected.

Figure 5.--Well-numbering system.
