INDEX TO LIMNOLOGICAL DATA FOR SOUTHCENTRAL ALASKA LAKES

by Mary A. Maurer¹ and Paul F. Woods²

INTRODUCTION

Southcentral Alaska lakes are a valuable natural resource and provide a variety of recreational opportunities to the public. Lakeside development has increased significantly in the past 10 years and several southcentral Alaskan lakes have documented pollution problems. Cultural eutrophication, the process by which man-induced nutrient loading to a lake results in large increases in biological productivity, can also produce noxious algae blooms, dissolved oxygen depletion at depth, reduced water transparency, and fish kills. The potential for cultural eutrophication of southcentral Alaska lakes prompted the U.S. Geological Survey (USGS) Water Resources Division and the Alaska Department of Natural Resources-Division of Geological and Geophysical Surveys (ADGGS) to provide lake researchers, managers, and the public with this index of published historical and current limnological references. The purpose of the index is to provide reference to the data which can be used to identify and monitor cultural eutrophication of southcentral Alaska lakes.

METHODS

The index is divided into five geographic areas, based on regional political boundaries (see map). The areas are: the Municipality of Anchorage, Matanuska-Susitna Borough, Kenai Peninsula Borough, Kodiak Island Borough, and the unincorporated area of the Copper River Valley and Prince William Sound. Each lake is listed with its official or unofficial name (according to USGS records), location, type of limnological data, and reference source. Lakes are located by latitude and longitude coordinates and quadrangle based on the USGS 1:63,360 series topographic maps.

Eight types of data are referenced in the index: morphometric, bathymetric map, water column profiles, transparency, general chemistry, nutrient chemistry, biological, and "other". Morphometric data refers to physical measurements such as mean depth, maximum depth, and lake volume. The bathymetric map refers to a depth-contour map of the lake. Water column profiles refer to physical and chemical measurements from the lake surface to lake bottom. Transparency refers to irradiance measurements and secchi disk readings. General chemistry refers to

² Hydrologist, U.S. Geological Survey, 230 Collins Road, Boise, Idaho 83702

field-determined water-quality properties (such as pH, conductivity, and dissolved-oxygen measurements) and chemical constituent analysis. Nutrient chemistry refers to analysis of nitrogen and phosphorus compounds. The biological category is separated into several subcategories: bacteria, chlorophyll, phytoplankton, zooplankton, algal growth potential, primary productivity, macrophytes, and benthic fauna. Fish data were not included in the index. The "other" data category refers to measurements such as lake level, water temperature, and lake outlet discharge. The reference is cited by author and date next to each "type of data" category. A complete bibliography of references is listed in a separate section after the index.

Acronyms and abbreviations of several public agencies were used in the index. These include:

Federal Agencies

USGS	U.S. Geological Survey
USFWS	U.S. Fish and Wildlife Service

State of Alaska Agencies

ADEC	Alaska Department of Environmental Conservation
ADF	Alaska Department of Fisheries
ADFG	Alaska Department of Fish and Game
AEIDC	University of Alaska, Arctic Environmental Information and Data Center

Alaska Department of Fish and Game (ADFG) "Federal Aid in Fish Restoration" reports are not listed by author but by volume number. Lake data are usually found in the "Inventory and Cataloging of Sport Fish and Sport Fish Waters" reports of each volume. Beginning with volume 19 in 1978, an abstract was included with these reports which lists specific report titles, making it easier to locate lake data.

The authors wish to emphasize that this index references only published and unpublished reports, and unpublished data stored in the USGS WATSTORE computer system, the only known digital limnological database on southcentral Alaska lakes. WATSTORE references are cited by the year data were collected. Extensive unpublished data files and lake maps at ADFG and Alaska Department of Environmental Conservation (ADEC) offices are not referenced, but information can be obtained by contacting those agencies' district or regional offices.

FINDINGS

The lake types considered in the index include glacial, organic-stained, and clear-water systems. Nearly 1,000 lakes were indexed: 330 in the Kenai Peninsula Borough, 252 in the Copper River Valley - Prince William Sound area, 220 in the Matanuska-Susitna Borough, 147 in the Kodiak Island Borough, and 43 in the Municipality of Anchorage. Lakes ranged in size from approximately 1 acre, such as Tiny Lake near Glennallen, to the 73,944 acre Tustumena Lake.

Coverage in each area was similar, with no area having significantly more or less lake data. However, the Matanuska-Susitna Borough had somewhat more complete coverage and more abundant data than the other areas. Many lakes in each area have only morphometric data, usually referring to maximum depth. Karluk Lake has the most extensive historical database. Several lakes have an extensive historical and current database. These include Big Lake (near Wasilla), Mirror Lake (near Chugiak), Bear Lake (near Seward), Lucile Lake (near Wasilla), and Paxson Lake (near Paxson). Big Lake, Robe Lake (near Valdez), and Mirror Lake have been intensively studied in the past 5 years and have a sufficient database to assess temporal trends in cultural eutrophication.

ACKNOWLEDGEMENTS

Preparation of this index was a cooperative effort between USGS and ADGGS as part of the Lake Eutrophication Project of the Alaska Water Resources Evaluation (AWARE) program. The authors wish to thank the librarians in Anchorage, Alaska, at the U.S. Department of Interior Alaska Resources Library, U.S. Fish and Wildlife Service, and ADFG for providing information on limnological literature. The authors also appreciate the assistance of Dave Nelson (ADFG, Soldotna, Alaska), John Murray (ADFG, Kodiak, Alaska), and Fred Williams (ADFG, Glennallen, Alaska) for providing lake locations.
