CONVERSION FACTORS

Inch-pound units in this report may be converted to metric units (International System) by using the following conversion factors:

<i>Multiply inch-pound unit</i>	<i>By</i>	<i>To obtain metric unit</i>
foot	0.3048	meter
mile	1.609	kilometer
square mile (mi ²)	2.590	square kilometer

Sea level: In this report "sea level" refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)--a geodetic datum derived from a general adjustment of the first-order level nets of both the United States and Canada, formerly called "Mean Sea Level of 1929."

GROUND-WATER HYDROGRAPHS, 1970-87, AND WATER-LEVEL DATA, 1986-87,
FOR THE NORTHERN HIGH PLAINS OF COLORADO

By Raymond L. Reed

ABSTRACT

During the winter of 1986-87, water-level measurements were made in 637 of the 641 wells that currently (1987) are monitored by the U.S. Geological Survey on the northern High Plains of Colorado. Hydrographs of water-level measurements for 1970-87 are included for each of these wells. Water-level measurements for the winter of 1986-87 are listed in a table; this table also lists the local number, geohydrologic unit(s), depth, and altitude of land surface of each of the 641 wells.

INTRODUCTION

The northern High Plains of Colorado is an area of about 9,500 mi² in the eastern part of the State (fig. 1). The boundaries of the High Plains of Colorado are the State line on the east and the limit of the Ogallala Formation of late Tertiary age on the north, west, and south. The Ogallala Formation is an unconsolidated or partly consolidated deposit of gravel, sand, silt, and clay and is the major aquifer in the northern High Plains (Borman and Meredith, 1983).

The ground-water level in much of the High Plains has been declining because pumping for irrigation is removing water from storage (Borman, 1983). Knowledge of the magnitude and extent of water-level change is necessary for management of the ground-water resource.

Reports about water levels in the northern High Plains of Colorado have been published periodically since the late 1950's. During the late 1950's and the early 1960's, the U.S. Geological Survey investigated ground-water resources in the northern High Plains. Data from these investigations were published initially as data releases accompanying U.S. Geological Survey water-supply papers. During the late 1960's and the early 1970's, water-level data for 5-year periods were published in basic-data releases by the Colorado Water Conservation Board. From the late 1970's until 1983, water-level information for the preceding 5 years was published annually as U.S. Geological Survey open-file reports. Seventeen years of water-level data were published by Reed (1987). This report contains water-level information for an 18-year period and includes much of the data from these previous reports.

Water-level data were obtained during water year 1987 (October 1, 1986, through September 30, 1987) in the northern High Plains of Colorado as part of

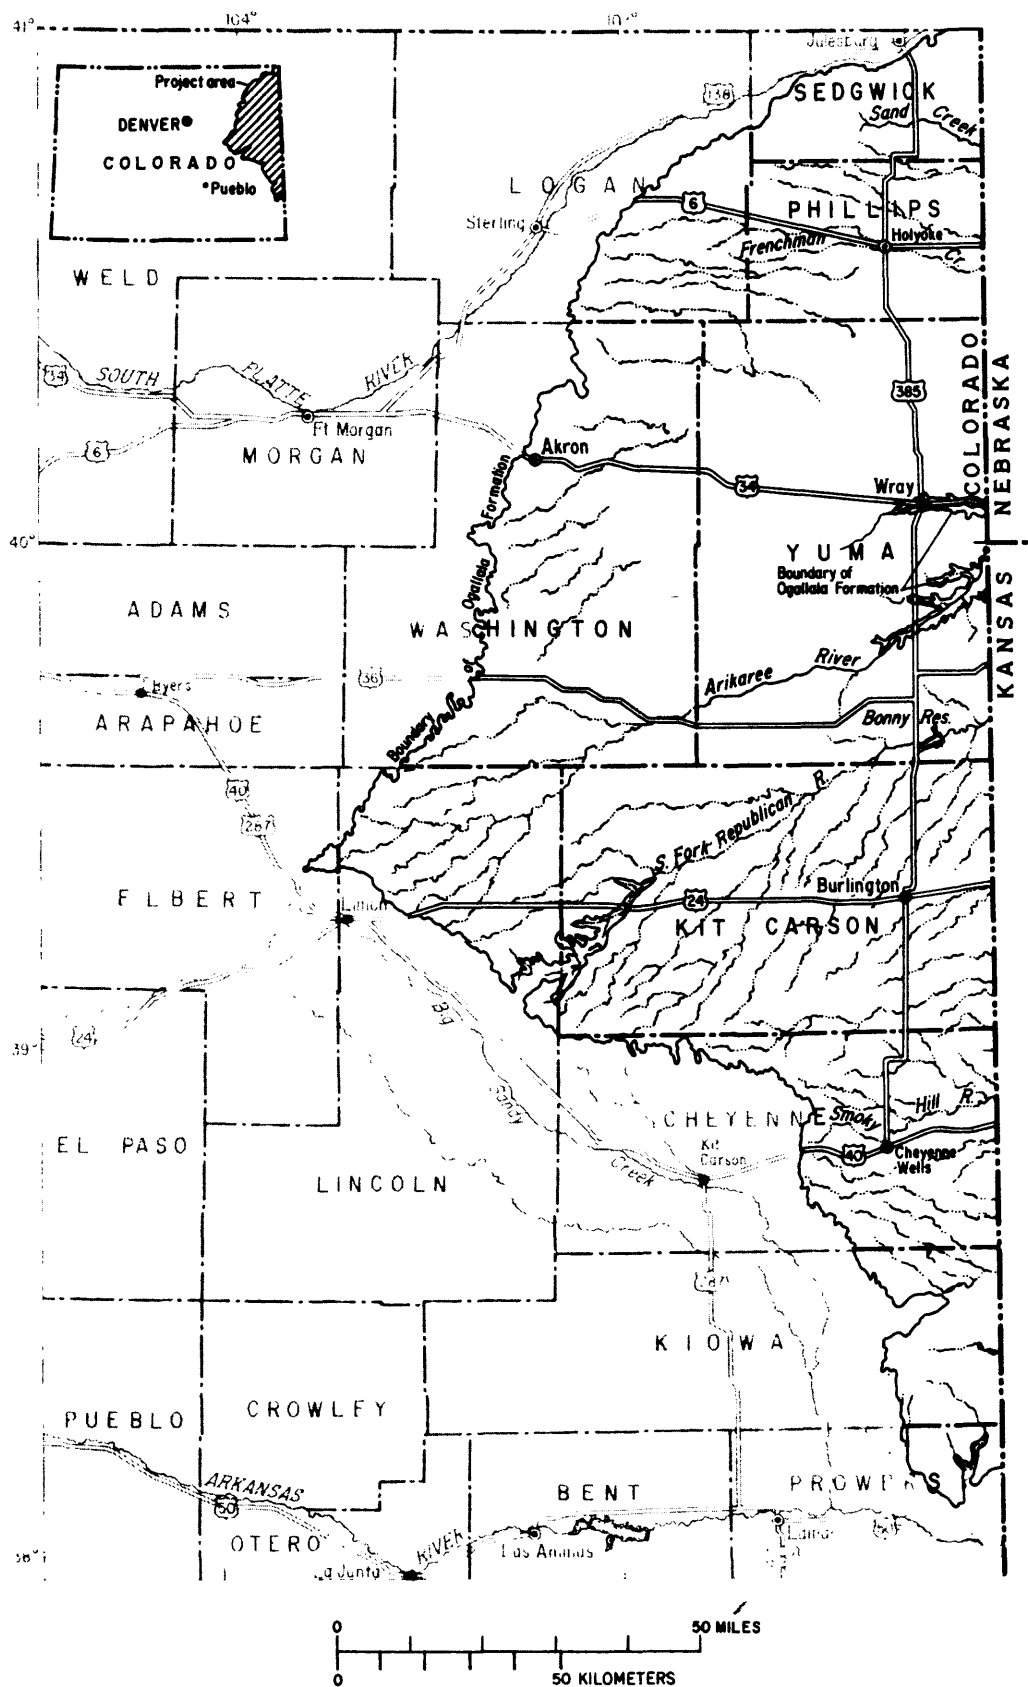

Figure 1.--Location of northern High Plains of Colorado.

a cooperative agreement between the U.S. Geological Survey and the Colorado Geological Survey of the Colorado Department of Natural Resources. Field-data collection was done by personnel of the Frenchman, Central Yuma, Sand Hills, and Marks Butte Ground Water Management Districts and the U.S. Geological Survey. Data from the field survey were added to the large, historical ground-water data base maintained in computers of the U.S. Geological Survey. Prior to 1986, ground-water information was obtained in cooperation with various State and local agencies and entities and also by several Federal programs. Organizations that helped obtain this ground-water information include: Colorado Geological Survey; Colorado Division of Water Resources, Office of the State Engineer; Colorado State University; Colorado Water Conservation Board; Frenchman Ground Water Management District; Central Yuma Ground Water Management District; Sand Hills Ground Water Management District; Marks Butte Ground Water Management District; Arikaree Ground Water Management District; Eastern Cheyenne Ground Water Management District; Plains Ground Water Management District; Washington-Yuma Ground Water Management District; and Southern High Plains Ground Water Management District.

SYSTEM OF NUMBERING WELLS

Well locations in this report are given local well numbers, based on the U.S. Bureau of Land Management system of land subdivision, and show the location of the well by quadrant, township, range, section, and position within the section (fig. 2). The first letter "S" preceding the location number indicates that the well is located in the area governed by the Sixth Principal Meridian. The second letter indicates the quadrant in which the well is located. Four quadrants are formed by the intersection of the base line and the principal meridian--A indicates the northeast quadrant, B the northwest, C the southwest, and D the southeast.

The first three digits of the number indicate the township, the next three digits the range, and the last two digits the section in which the well is located. The letters following the section number locate the well within the section. The first letter denotes the quarter section, the second the quarter-quarter section, and the third the quarter-quarter-quarter section. The letters are assigned within the section in a counterclockwise direction, beginning with A in the northeast quarter section and within each quarter-quarter section in the same manner. Where two or more locations are within the smallest subdivision, consecutive numbers beginning with 1 are added in the order in which the data from the wells or springs were collected. For readers who wish to locate the wells, the townships and ranges are shown on plate 1.

Another number, station-identification number, is assigned according to the grid system of latitude and longitude. The number consists of 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude; the next seven digits denote degrees, minutes, and seconds of longitude, and the last two digits (assigned sequentially) identify the wells within a 1-second grid. In the rare instance where the initial latitude and longitude was in error and has been redetermined, the station will retain its original identification number.

DESCRIPTION OF DATA

For a number of years, the U.S. Geological Survey and various State and local agencies have cooperated in the measurement of water levels in many of the wells that are located in the northern High Plains of Colorado. Since its inception, this network of wells has changed almost annually. Because some wells simply are more difficult to measure than others, their measurement may be discontinued when consistently accurate water levels are not obtained. Wells also are dropped from the measurement list if measurements cannot be obtained. Some reasons for not being able to measure the water levels are: access to the well is obstructed; the well is destroyed; the water level has dropped below the bottom of the well; or a well owner has withdrawn permission to measure the well. Wells may be added to the network, as resources permit, to provide needed additional information.

The current (1987) water-level monitoring network consists of 641 wells; 637 were measured during the winter of 1986-87. Most of these wells are used for irrigation, but several livestock wells and U.S. Government observation wells also are included, especially in areas where there is minimal irrigation.

The data in this report are arranged first by county; the counties are listed alphabetically. The wells in each county then are arranged by local well number, in ascending order.

Hydrographs for each of the 641 observation wells in the northern High Plains of Colorado are shown in figure 3 in the "Hydrologic Data" section of this report. A hydrograph is a diagram representing successive water-level measurements throughout a period of time. The hydrographs in figure 3 include measurements made during 1970 through the winter of 1986-87. The line connecting the measurements on the hydrograph does not necessarily indicate the actual water level between measurements, but may indicate a trend in the water level. The actual water level between measurements will fluctuate depending on the drawdown of the water table caused by pumpage and on recharge that occurs.

Descriptive information for each well and water-level measurements made during the winter of 1986-87 are listed in table 1. For various reasons, water levels were not obtained during this period for four of the wells, and more than one water level was obtained for other wells.

HYDROLOGIC DATA

Hydrographs of water levels for wells in the northern High Plains of Colorado are shown in figure 3. The following information is provided to define terms used in the figure.

County name: Name of the Colorado county where the well or wells are located, for example: CHEYENNE COUNTY.

Local well number: Indicates a number (based on latitude and longitude) used to identify the location of the well, for example: SC01204310ADA. See "System of Numbering Wells," section.

Station-identification number: Indicates a number (based on latitude and longitude) used to identify a well, for example: 390147102121600. See "System of Numbering Wells" section.

y-axis: Water level, in feet below land surface, and altitude of water level, in feet above sea level.

x-axis: Time in years, from 1970 through 1987 - calendar year.

□ : Water level at the time of measurement, line between squares indicates the trend in static water level between measurements.

Table 1.--Water-level record (winter 1986-87)

Local well number: See "System of Numbering Wells" section.

Geohydrologic unit: Geologic strata or aquifer in which the well was completed. The geohydrologic unit symbols are described by age and stratigraphic unit or aquifer as follows:

Age	Stratigraphic unit or aquifer	Symbol
Quaternary	Quaternary System	QUATERNARY
	Alluvium	ALLUVIUM
	Dune sand	DUNE
	Pleistocene Series	PLEISTOCENE
Tertiary	Ogallala Formation	OGALLALA
	White River Group	WHITE RIVER
	Chadron Formation of the White River Group	CHADRON
Cretaceous	Pierre Shale	PIERRE
	Niobrara Formation	NIOBRARA

Depth of well: Feet below land surface; ---, exact depth of well is unknown.

Altitude of land surface: Feet above National Geodetic Vertical Datum of 1929.

Water-level date: Month-day-year of measurement.

Water level: Feet below land surface, to nearest one hundredth of a foot;
--, well was visited, but no water level was obtained.
