Structure contour map

EXPLANATION

Structure contours—Approximately located; dashed where little or no control. Drawn on top of Dakota Sandstone in northwestern part of map and on top of Trinidad Sandstone in northeastern part. Structure contours were constructed using data from geologic and topographic maps; Rocky Mountain Well Log Service; Conservation Division, U.S. Geological Survey; Oil and Gas Branch, Geological Division, U.S. Geological Survey; and Kaiser Coal Corporation. Some contours were interpolated from lines (1965) and Wood and others (1953). Contour interval, 100 ft (30.48 m). Datum is mean sea level. Few wells have been drilled in the area and well-log control is meager; however, in the northwestern part of the map, parts of the Batón coal field have been actively explored and well-log control is more adequate.

Structure contours on the Trinidad Sandstone by C.L. Pillmore; structure contours on the Dakota Sandstone by G.R. Scott
