

SAMPLE LOCALITY--indicates the center of a cell (2.5 km on a side) where the high values from all samples within the cell are plotted. Anomalous concentrations of the metals copper (Cu), molybdenum (Mo), zinc (Zn), and tungsten (W shown at the center of the cell) would be indicative of a porphyry copper occurrence whereas anomalous concentrations of some of these metals along with lead (Pb) and/or silver (Ag) might be indicative of a polymetallic vein occurrence. Anomalous concentrations of arsenic (As), antimony (Sb), mercury (Hg) and/or gold (Au) would be indicative of an epithermal precious-metal vein occurrence.
