INDEX OF SURFACE-WATER DISCHARGE, WATER-QUALITY, SEDIMENT, AND BIOLOGICAL
RECORDS THROUGH SEPTEMBER 30, 1990, FOR WYOMING

By N.K. Ruby, R.J. Sagmeister, Sharon L. Green, and J.D. Walgren

ABSTRACT

Streamflow and reservoir stations in and adjacent to Wyoming are indexed in this report listing dates that surface-water, water-quality, sediment, and biological data were collected and published. The listing is limited to those stations that have been part of systematic data-collection monitoring networks. Miscellaneous sites are not included.

This report lists the station name and identification number, the drainage area, if known, and period of record (calendar years) through September 30, 1990.

The report is similar to previous nationwide indexes of streamflow and reservoir stations, published for stations with a period of record prior to October 1, 1970. This report supersedes those publications, as they pertain to the State of Wyoming.

INTRODUCTION

This report lists the period of record (calendar years) for streamflow and reservoir stations in and adjacent to the State of Wyoming that have been part of discharge, water quality, sediment, or biological monitoring networks through September 30, 1990. Data for the stations have been previously published in reports of the U.S. Geological Survey (USGS). Sites that were not part of a systematic data-collection monitoring network during any particular year are not included in this report. These are miscellaneous sites, such as those having data from one visit or were part of an investigative, short-term project. However, dates for data collected at an established network station, while part of an investigative, short-term project, are included in this report.

Indexes of surface-water records for streamflow and reservoir stations by basin have been published nationwide by the USGS. The most recent indexes listed stations with a period of record prior to October 1, 1970. This index comprises all stations in those indexes specific to Wyoming, plus the next station downstream from the State boundary, if there is not a station at the boundary. Indexes of surface-water records for Wyoming stations, which were included in U.S. Geological Survey Circulars 656, 659, 660, and 663 (U.S. Geological Survey, 1971), are superseded for Wyoming by this report. No previous indexes have been published for chemical quality, sediment, and biological records.

Records of discharge or stage of streams, and contents or stage of lakes and reservoirs were first published in a series of USGS Water-Supply Papers entitled "Surface Water Supply of the United States." Through September 30, 1960, these Water-Supply Papers were published by water year (12-month period, October 1 to September 30) in an annual series and then in a 5-year series for water years 1961-65 and water years 1966-70. Records of chemical quality, water temperatures, and suspended sediment were published by water year from 1941 to 1970 in an annual series of Water-Supply Papers entitled "Quality of Surface Waters of the United States." Water-Supply Papers may be consulted in the libraries of the principal cities in the United States or may be purchased from Books and Open-File Reports Section, U.S. Geological Survey, Box 25425, Federal Center, Denver, CO 80225.

Beginning October 1, 1960 through September 30, 1970, streamflow data were released by USGS in annual reports on a state-boundary basis. Water-quality records for 1964-70 were similarly released either in separate reports or in conjunction with streamflow records.

Beginning with water year 1971, data for streamflow and water quality were combined into one report and have been published in USGS Water-Data Reports by state. These reports are identified by a number consisting of the two-letter state abbreviation, the last two digits of the water year, and the volume number. Water-Data Reports are for sale in paper copy or in microfiche by the National Technical Information Service, U.S. Department of Commerce, Springfield, VA 22161.

In addition to Water-Data Reports, data also are available through the National Water Data Storage and Retrieval System (WATSTORE) operated and maintained on the central computer facilities of the USGS at its National Center in Reston, VA. Data specific to Wyoming also is maintained on computer facilities at the Wyoming District Office, 2617 E. Lincolnway, Cheyenne, WY 82001.

DOWNSTREAM ORDER

The stations in this index are listed in the downstream order used in the series of Water-Supply Papers on surface-water supply of the United States since 1951. Starting at the headwater of each stream, all stations are listed in a downstream direction. Tributary streams are indicated by indentation (one indentation of two spaces for each rank) and are listed between main-stem stations in downstream order as they enter the main-stem stream. Likewise, streams of less important rank are listed similarly in downstream order as they enter between stations on the stream of more important rank. If station names fail to show the complete sequence of tributaries and ranks, a stream name only is inserted to complete the series unless that series is complex and undetermined, in which case a double indentation (four spaces) is used to indicate that the ranking of tributaries is incomplete.

STATION NAME

Station names are given in their most recently published form. Parentheses around part of a station name indicate that the enclosed word or words were used in an earlier published name of the station or as an alternate name. Parenthetical explanations also are used to indicate that a stream of a different name is the head of the main stream by use of "(head of _____ River)."

STATION NUMBER

As an added means of identification, each monitoring-network station has been assigned a station number. The numbers have been assigned in the same downstream order used in this index. In assigning station numbers, gaps were left to allow for new stations that may be established; hence the numbers are not consecutive. The complete number for each station consists of eight digits. The first two digits represent the part number and the last six the station number. The part number designates the major river basin shown in figure 1. Part numbers for the major basins in Wyoming are as follows:

- 06 - Missouri River basin
- 09 - Colorado River basin
- 10 - The Great Salt Lake Basin
- 13 - Snake River basin

For example, 06279500 is the station number for the Bighorn River at Kane, Wyo. The 06 prefix designates the station as being in the Missouri River basin.

DRAINAGE AREA

The drainage area, in square miles, is the latest figure published or otherwise available at this time.

PERIOD OF RECORD

The "Period of record" column shows the period of record for the systematic monitoring-network stations. The dates given are the calendar years in which a record began or ended; breaks of less than a year are not shown. For example, if a record began in October 1923, ended in April 1932, began again in March 1933, and ended in September 1944, the period of record would be shown as 1923-44.

A date followed by only a dash shows that the station was continued in operation beyond September 30, 1990. A date followed by a period indicates discontinuance. A date followed by a semicolon indicates a break in the collection of records.

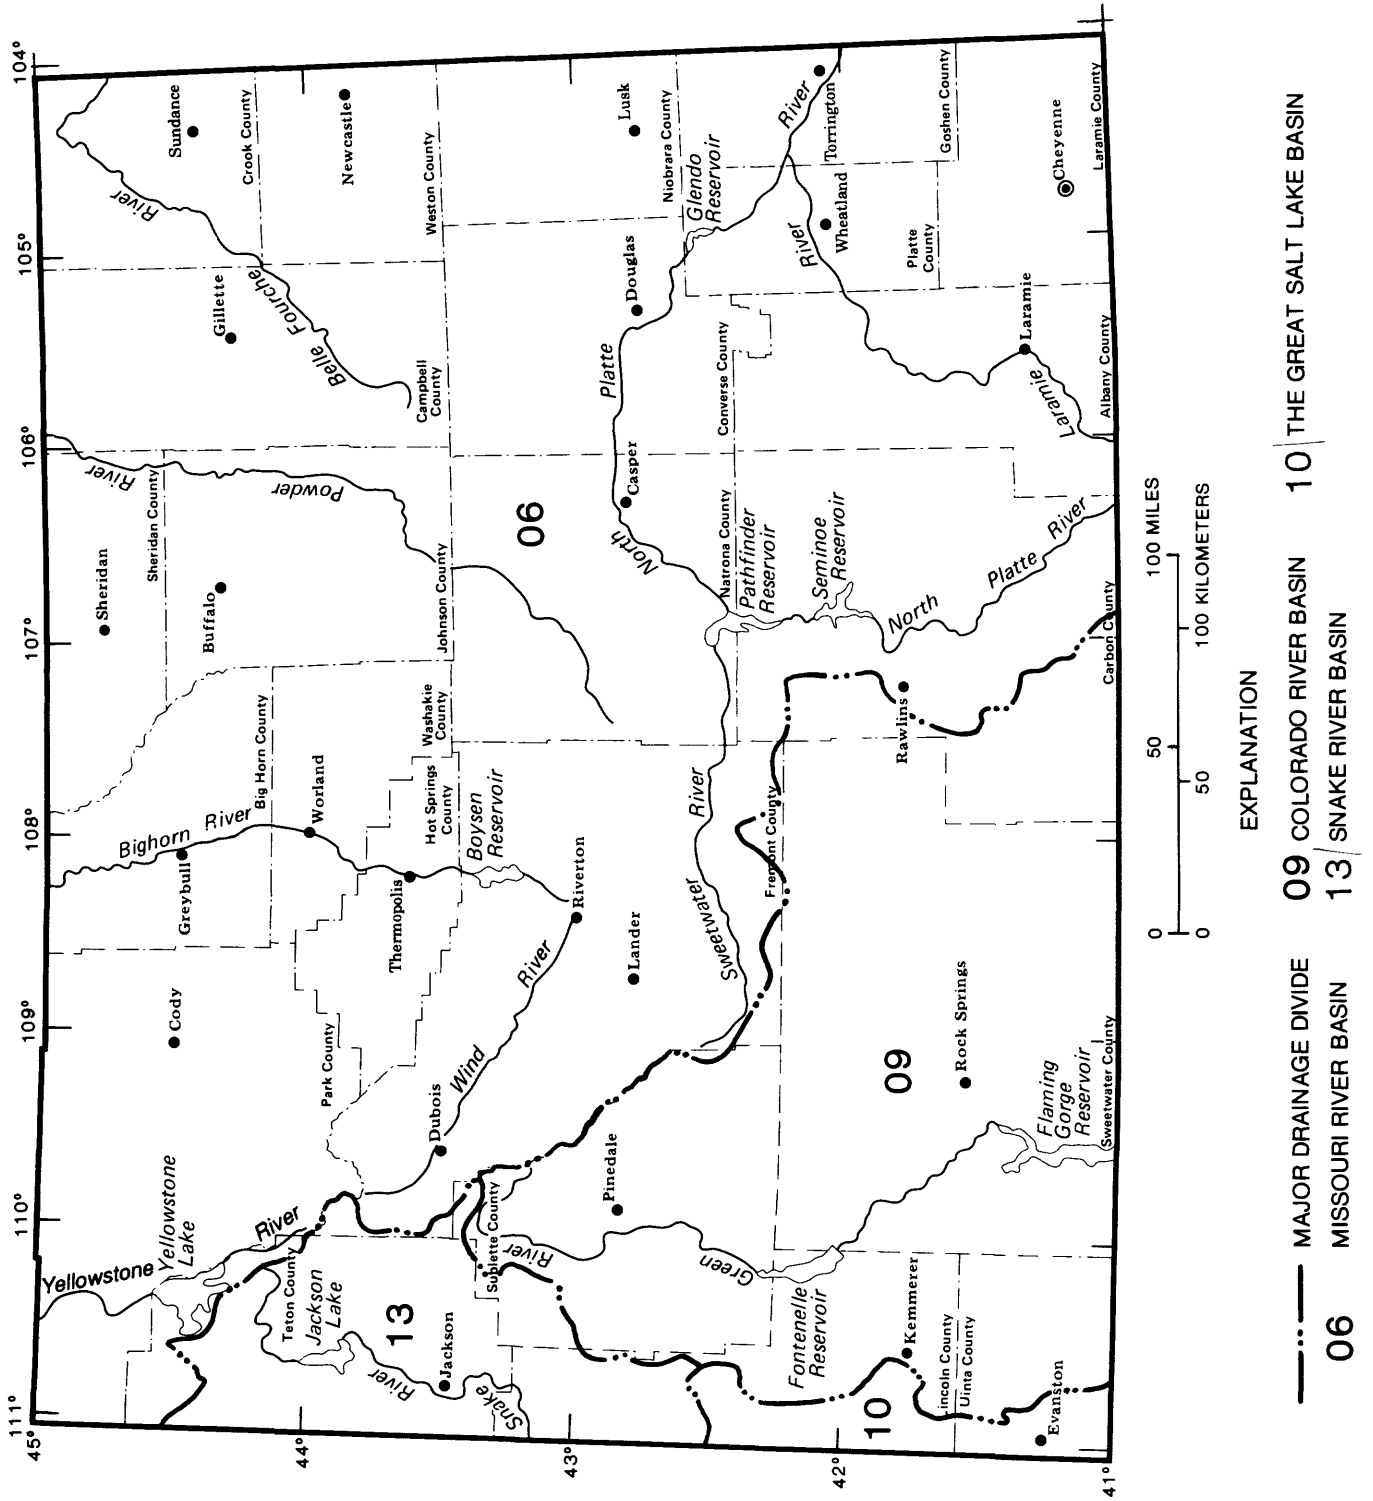

Figure 1.--Location of major drainage basins in Wyoming.

A period of record for the same continuous-record station published by other agencies (or available only in files of the USGS or another agency) is listed only when it is for a period not published in reports of the USGS. This period is indicated by footnotes. A period of record for data collected by other agencies is included only for stations for which there is some record published in USGS reports.

The first column, "Daily or monthly discharge or content" shows the period of record for a continuous-record gaging station. A continuous-record station is a streamflow-gaging station on a stream or reservoir for which the data to determine discharge, stage, or contents is collected to allow publication of daily, weekly, or monthly values for a continuous period of time.

The second column, "Annual peak discharge" shows the period of record for a crest-stage partial-record station. A crest-stage partial-record station is a streamflow-gaging station for which only the annual peak discharge is determined.

The third column, "Water quality" shows the period of record for chemical-quality data, including continuous temperature records collected at network stations. The fourth column, "Sediment" and the fifth column, "Biology" shows the period of record for sediment and biological data collected at network stations.

Explanation of footnotes is given at the end of the index.
