# Introduction

In the summer of 1987, the U.S. Geological Survey (USGS), in cooperation with the Geological Survey of Canada (GSC), collected three 130-km-long seismic-refraction/wide-angle reflection profiles and a 17-km-long reflection profile in central Alaska (Figure 1), as part of the ongoing Trans-Alaska Crustal Transect (TACT); (see Page and others, 1986). The three profiles were recorded using 120 USGS cassette recorders and 12 to 20 GSC PRS-1 digital recorders deployed at pre-surveyed sites with 1 km spacing. The reflection survey was recorded using 120 USGS cassette recorders deployed at 60 m spacing. A total of 48 shots, ranging from 227 to 2725 kg of explosive, were detonated in 30 to 50-m-deep drill holes, and in 2 to 15-m-deep lakes.

The southernmost refraction profile, the Alaska Range deployment, extends northward from near Paxson to south of Delta Junction (Figure 1). This profile lies along or near the Richardson Highway crossing the northern part of Wrangellia terrane and southern part of Yukon-Tanana terrane and is centered on the Denali fault.

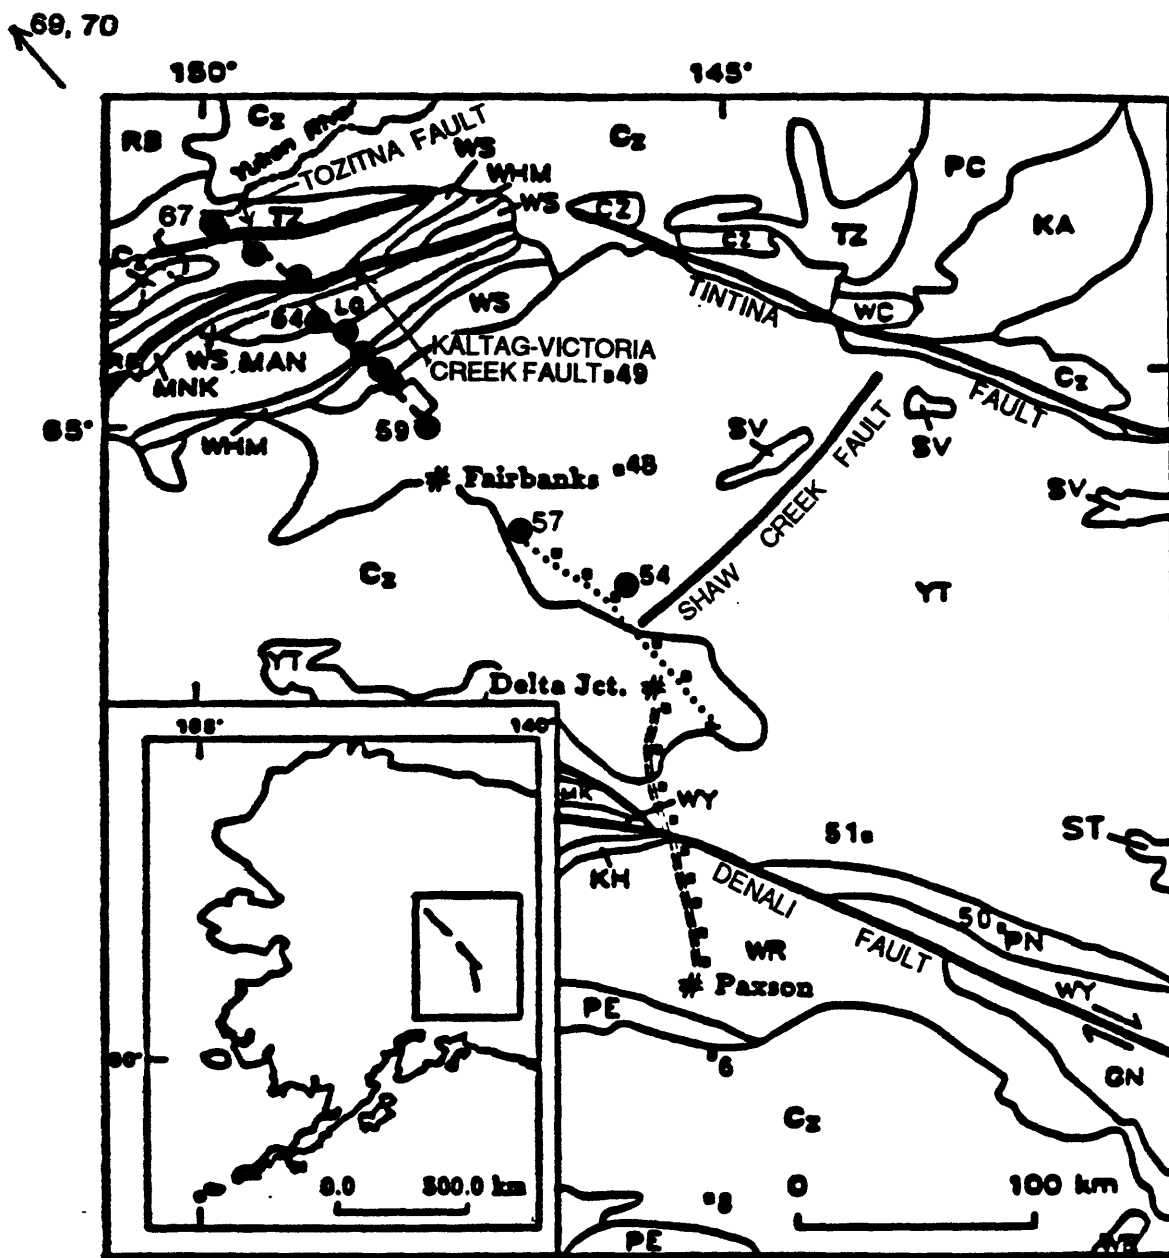

The central profile, the Fairbanks South deployment, begins approximately 20 km southeast of Delta Junction and extends northwestward to a point 30 km southeast of Fairbanks, following the Trans Alaska Oil Pipeline right-of-way (Figure 1). This profile lies within the Yukon-Tanana terrane crossing no major terrane boundaries. The Shaw Creek fault projects across the central part of this deployment.

The northernmost refraction profile, the Fairbanks North deployment, begins 30 km northwest of Fairbanks and follows the Elliot and Dalton highways and the pipeline right-of-way to the Yukon River (Figures 1, 2). This profile crosses the Yukon-Tanana terrane and numerous smaller terranes to the northwest.

The 17 km Olmes reflection profile, collected as an experiment to enhance detection of any vertical-incidence reflections that might be observable on this part of the line, is coincident with the southernmost part of the Fairbanks North deployment (Figures 1, 3).

Open-File Report 89-321 (Beaudoin and others, 1989) reports the data for the Alaska Range and Fairbanks South profiles. This report addresses the Fairbanks North and Olmes deployments. A SEG-Y standard format magnetic tape of these data may be obtained by writing or calling:

## Geologic Setting

The Fairbanks North deployment crosses most of the complex suture region between the Yukon-Tanana and Ruby terranes (Figure 1), which is occupied by numerous terranes that are elongate in a northeast-southwest direction. Areally, the largest ones are the Manley and Tozitna terranes (MAN, TZ, Figure 1). Most terrane-bounding faults in this suture region are interpreted as shallowly to moderately southeast-dipping Mesozoic thrust faults (Dover, 1990). In addition, steeply dipping faults, including the Kaltag-Victoria Creek and Tozitna faults, offset these terranes and are believed to be westward extensions or splays of the Tintina fault system (Dover, 1990; Weber, 1990).

The Yukon-Tanana terrane (YT, Figure 1) is a composite metamorphic terrane of Proterozoic to Devonian metasedimentary and metavolcanic rocks, and Devonian and Mississippian metaplutonic rocks intruded by Mesozoic and Tertiary plutons (Nokleberg and others, 1989). Regional metamorphic facies range from lower greenschist to high amphibolite facies in different subterrane. Major lithologies include: quartzite, augen gneiss and biotite gneiss, semischist, amphibole schist, pelitic schist, and quartz-feldspathoid schist (Dusel-Bacon and Aleinikoff, 1985; Nokleberg and others, 1989). This terrane occupies the region between the Tintina and Denali faults (Nokleberg and others, 1989) and extends into the Yukon Territory and British Columbia, Canada. It is considered to be a parautochthonous North American terrane that has moved northwestward as much as 450 km (Templeman-Kluit, 1979; Mortensen and Jilson, 1985) to 900 km (Gabrielse, 1985). Displacement on the Denali fault is estimated to be 400 km in a right-lateral sense (Nokleberg and others, 1985).

The Tozitna terrane, beneath much of the northern part of the profile (TZ, Figure 1) is oceanic and consists of Mississippian to Triassic deep-marine sedimentary and volcanic rocks and Triassic (and older?) diabase and gabbro (Jones and others, 1987; Dover, 1990). Structure is complex. This terrane is interpreted to have been thrust great distances (hundreds of km) over the Ruby terrane (RB, Figure 1); hence the Ruby terrane probably underlies the north part of the profile at depth (Jones and others, 1987; Patton and others, 1989; Dover, 1990).

The Ruby terrane (RB, Figure 1), north and west of the profile, closely resembles on one hand the Yukon-Tanana terrane, and on the other hand the Arctic Alaska terrane of the Brooks Range, in that it consists of Devonian and older metasedimentary and metaplutonic rocks intruded by Mesozoic and Tertiary plutons

(Patton and others, 1989; Dover, 1990). Regional metamorphic facies is dominantly greenschist, but includes local amphibolite and high-pressure greenschist facies.

The Manley terrane (MAN, Figure 1) is composed of flyschoid Mesozoic sedimentary rocks that are complexly deformed and intruded by mid-Cretaceous plutons (Jones and others, 1987). Dover (1990) includes adjacent bodies of similar but older (Devonian and/or Mississippian) rocks. This terrane apparently represents a closed ocean basin and may, like the flyschoid Kahiltna terrane in the Alaska Range to the south, underlie much of the region adjacent to its outcrop area (see Stanley and others, 1990).

Smaller terranes crossed by the Fairbanks North profile include the Wickersham, White Mountains, and Livengood terranes, (WS, WHM, LG, Figure 1). The Wickersham terrane (WS, Figure 1) is largely unmetamorphosed clastic, continental-marginal (quartz-rich) sedimentary rocks of Cambrian and/or Proterozoic age. The White Mountains terrane (WHM, Figure 1) consists of alkali-basaltic volcanic rocks, deposited locally on rocks equivalent to the Wickersham terrane, and overlain by Silurian limestone. The Livengood terrane (LG, Figure 1) consists chiefly of Proterozoic to lower Paleozoic oceanic rocks, including mafic and ultramafic rocks, carbonate, chert and shale. These rocks are highly folded but not strongly metamorphosed.

Weber (1990) considers the Tozitna and Kaltag-Victoria Creek faults to be deformed extensions of the Tintina fault; the more southerly, the Kaltag-Victoria Creek fault, is interpreted as older. She postulates even older buried strike-slip faults farther south that have been obscured by younger thrust faults in the area. Dover (1990) argues that the strike-slip faulting is entirely younger than the thrust faulting and interprets 400 km of post-thrusting offset on the Kaltag-Victoria Creek/Tozitna/Tintina system; a similar offset, 450 km, has been documented for the Tintina system farther southeast in Canada, where strike-slip faulting is clearly younger than thrusting (Templeman-Kluit, 1979; Mortensen and Jilson, 1985).

## Seismic Recorders

The USGS cassette recorders have been described by Murphy (1988). The system consists of a Mark Products L4A 2-Hz geophone, a set of three parallel amplifiers with adjustable gain settings, a clock and memory board, and a cassette recorder (Figure 4). The use of three parallel amplifiers with gains set so that the dynamic ranges of the amplifiers overlap, affords a variable total dynamic range. For most of the instruments deployed, that range was 84 dB (Murphy, 1988). The signal from the geophone is passed through a signal splitter, the three amplifiers, and recorded as a multiplexed analog signal along with a reference frequency and an internally generated time code (IRIG E). Curves showing displacement and velocity versus frequency for the entire system peak at approximately 26 Hz and 6 Hz respectively (Figure 5).

The PRS-1 system used by the GSC also uses a Mark Products L4A 2 Hz geophone. These digitally recording instruments have a total dynamic range of 126 dB. Curves showing displacement and velocity versus frequency for this system peak at approximately 17 Hz and 5 Hz respectively (Figure 6) (Asudeh, pers. comm. 1988).

## Data Collection and Reduction

For the 130 km long Fairbanks North deployment, 120 USGS instruments and 12-20 GSC instruments were deployed primarily along the Dalton Highway at 1.1 km spacing. In places where the highway diverged significantly from a straight line, instruments were deployed along the right-of-way of the Trans-Alaska Oil Pipeline (Figure 2). Nine shots, averaging 15 km apart, and ranging in size from 454 to 1361 kg. were detonated within the line of instruments. Five shots, including one fan shot, were detonated at distances of up to 109 km from the line of instruments (Figures 1, 2; Table 1). Maximum shot-receiver distances reached 240 km (Appendix A). All shots were detonated in 20.3cm X 32-55m drillholes except at shotpoints 54, 70, and 74, where shots were detonated in shallow (3-6m deep) lakes.

For the 14 km long Olmes deployment, 120 USGS instruments were deployed twice along the southern end of the Fairbanks North deployment, at a spacing of 60 m (Figure 3). Three 45 kg shots were fired at shotpoints 59, 60, and 61 into both deployments (Table 1). Maximum offsets reached 30 km (Appendix A).

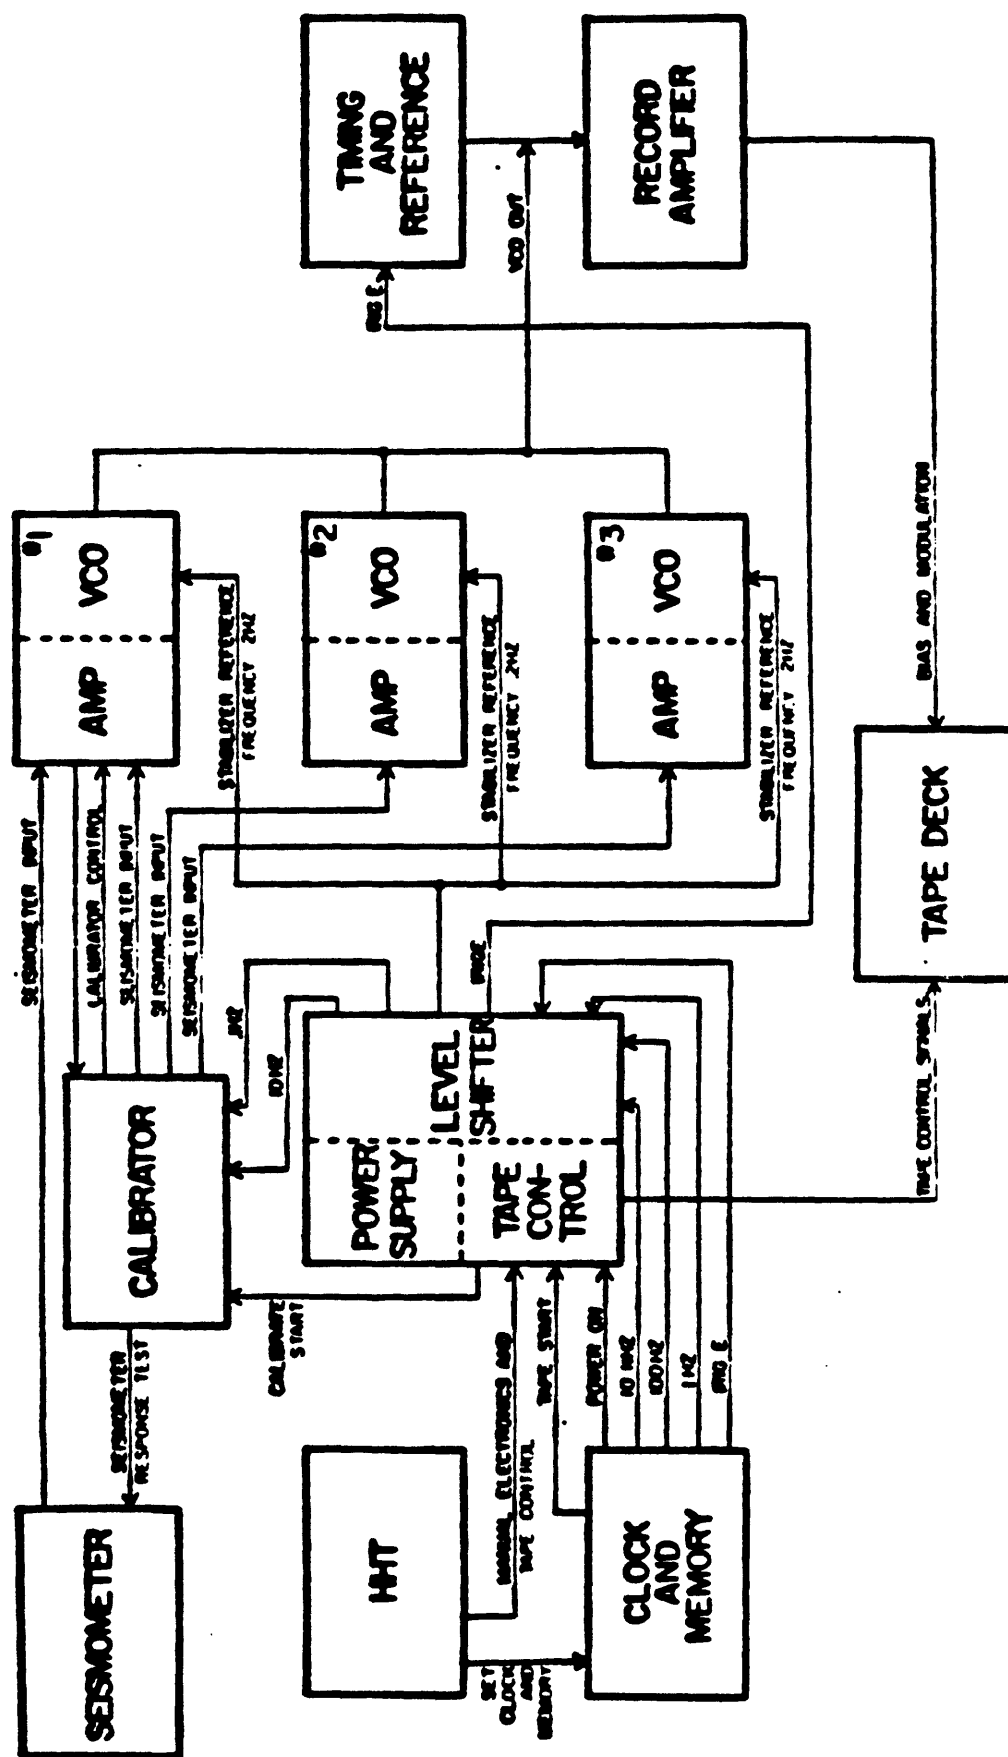

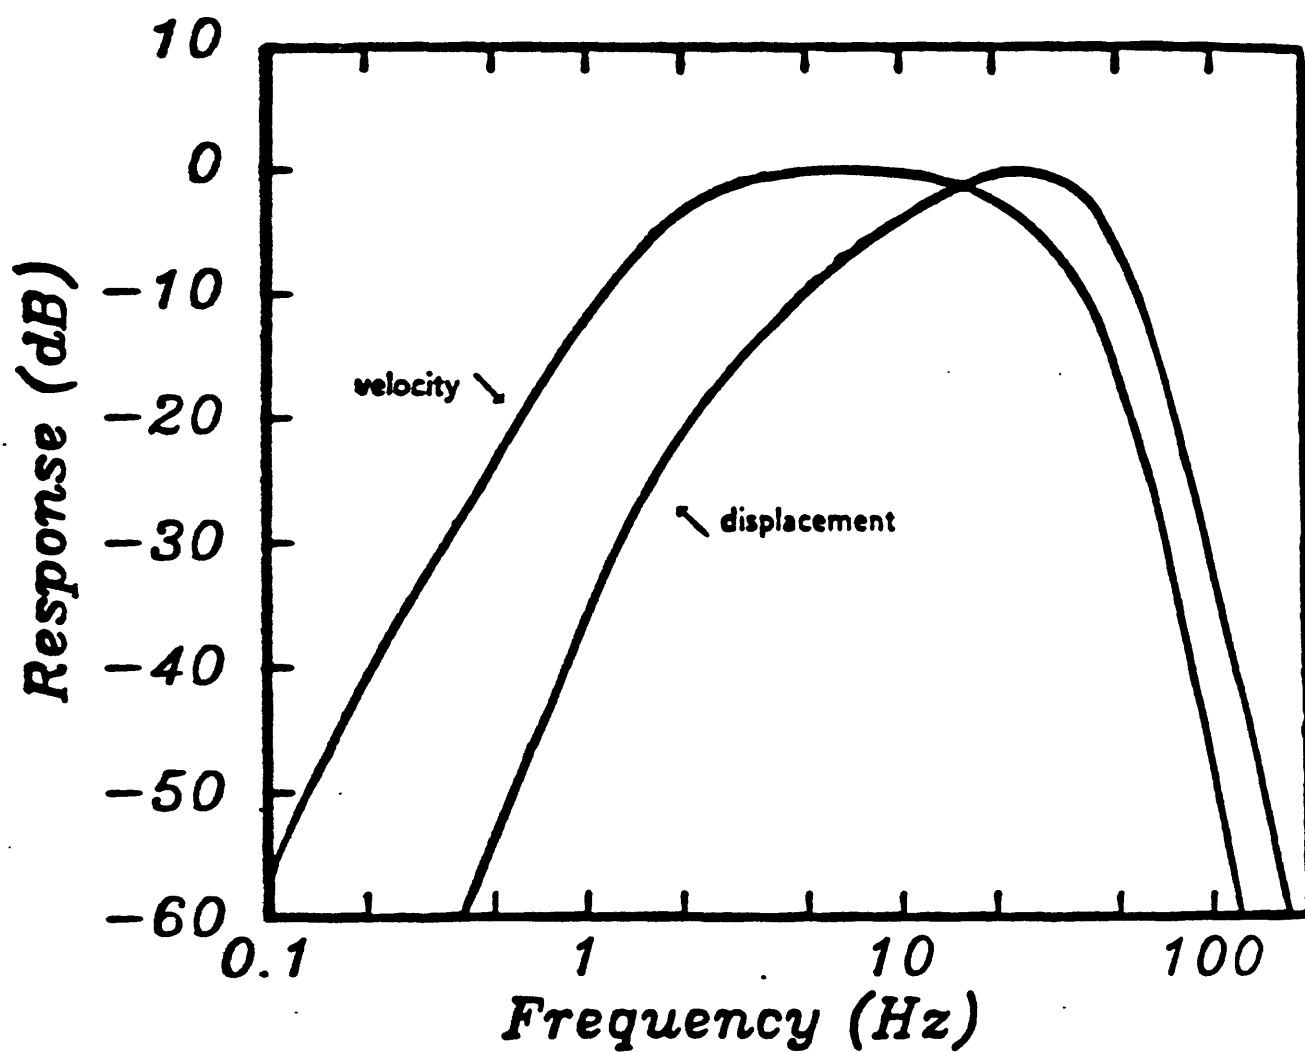

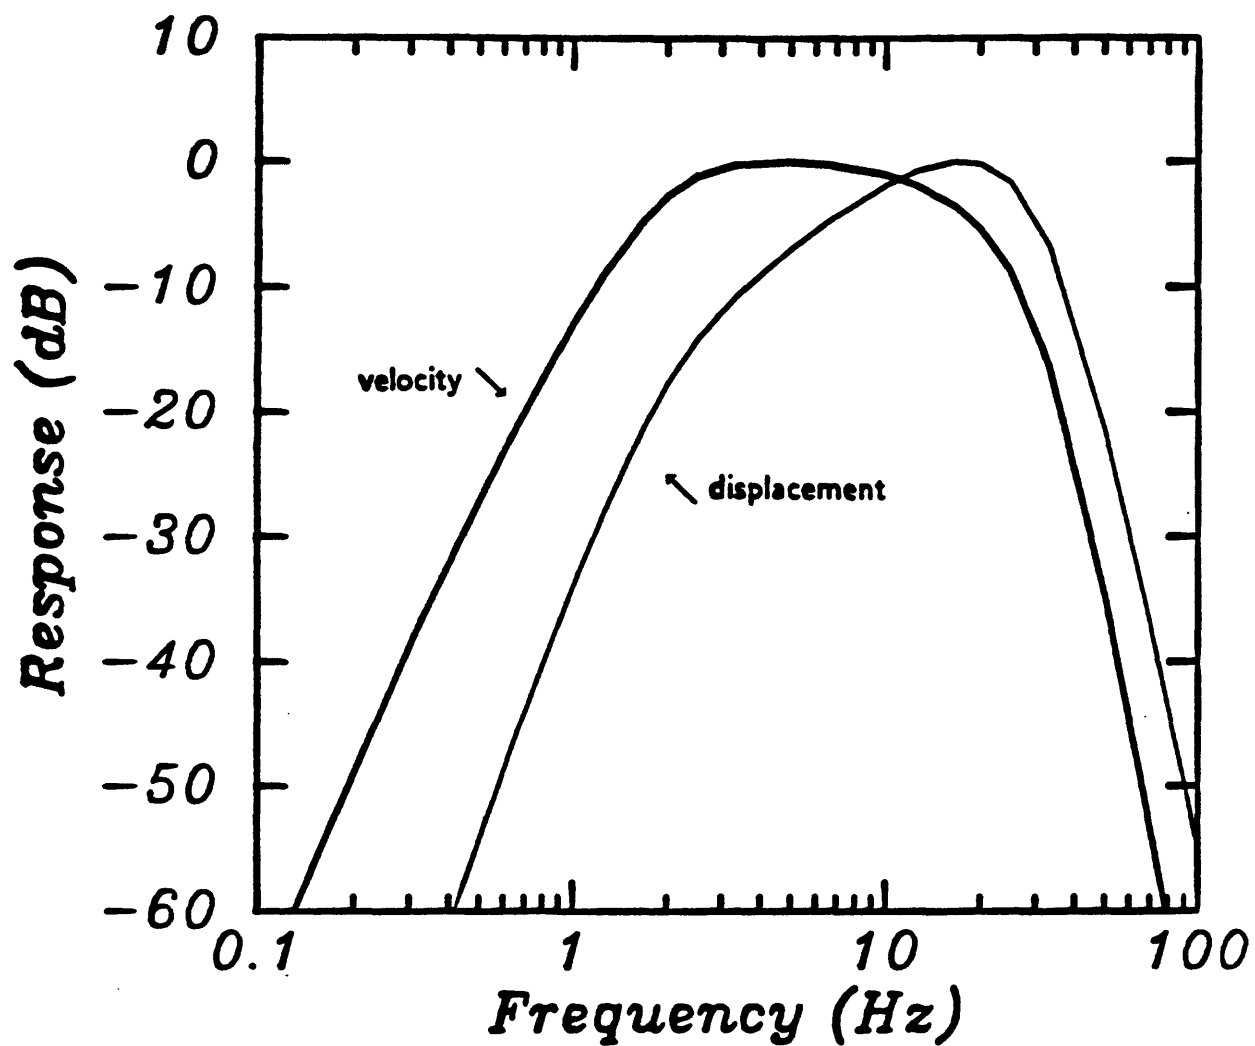

Figure 4. Schematic of U.S.G.S. cassette recorder system. (from Murphy, 1988)

**Figure 5.** Theoretical velocity and displacement response curves for the U.S.G.S. cassette recorders. Maximum velocity and displacement responses peak at 6 Hz and 26 Hz respectively. (from Murphy, 1988)

**Figure 6. Theoretical velocity and displacement response curves for the EDA digital recorders. Maximum velocity and displacement responses peak at 5 Hz and 17 Hz respectively.**

The instruments were deployed at pre-surveyed sites that were located using orthophotos, infrared photos, and topographic maps all at the scale of 1:63,360. Site locations have estimated errors of 50 m laterally and 25 m in elevation. From these maps latitude, longitude, and elevation are obtained for both shot and instrument locations (Appendix A). Shot-to-Instrument distance and azimuth and instrument amplifier gain settings are listed in Appendix B.

The analog data recorded on the USGS cassette recorders is converted to digital data using a mini-computer. Twenty seconds of data is digitized for each recorder per shot with a sampling interval of 5 ms. The digitizing start time is calculated as follows:

$$t_{start} = t_{shot} + t_{cd} + t_{min} + x_{ij} / v_{red}$$

where:  $t_{shot}$  is the shot time

$t_{cd}$  is the recorder clock drift time at shot time

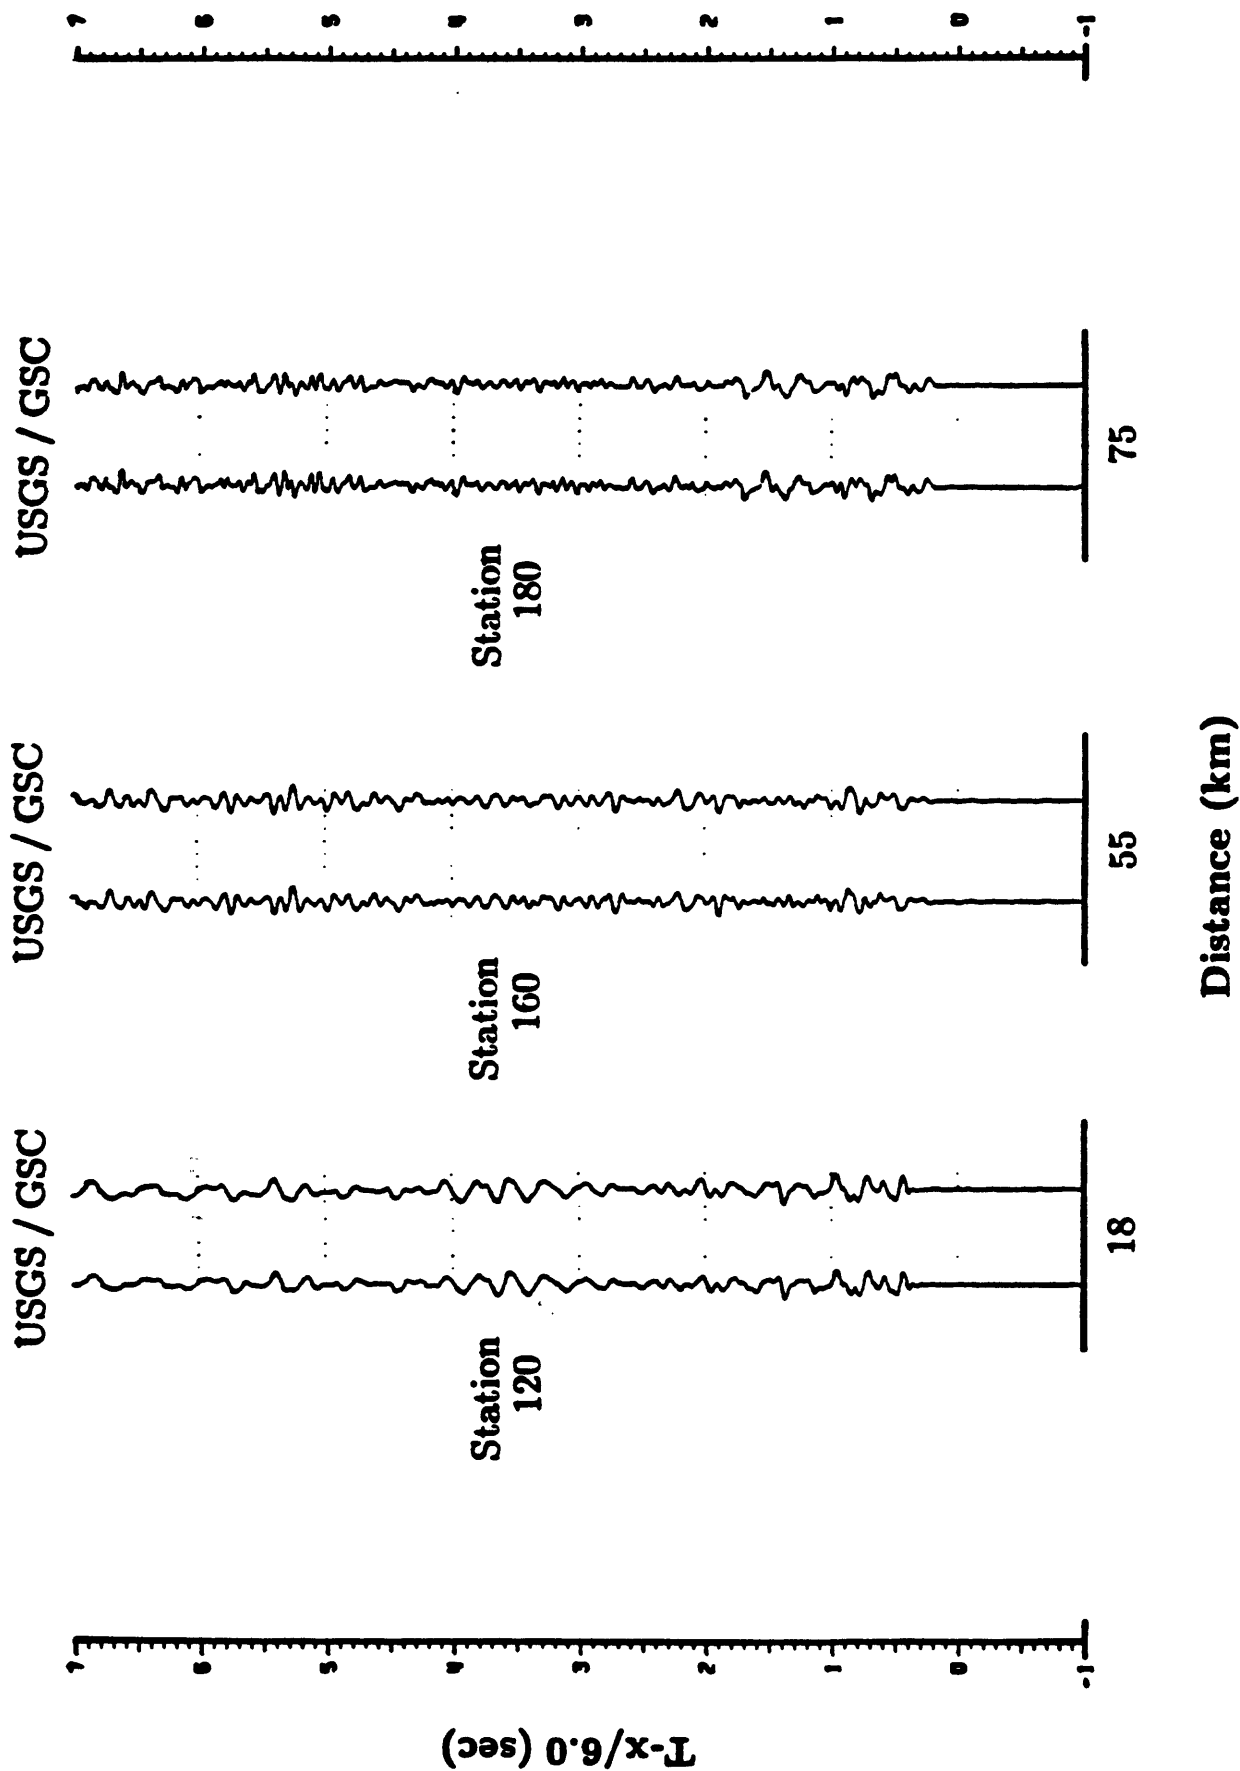

$t_{min}$  is -2 s or -4 s depending on shot-station range

$x_{ij}$  is the shotpoint(*i*) to recorder(*j*) range

$v_{red}$  is the digitizing reducing velocity

USGS cassette recorders and GSC digital recorders were deployed at coincident sites (120, 140, 160, 180, 200) for the Alaska Range deployment. Coincident sites afforded comparison of wave forms and first break arrival times for the two instruments (Figure 7) (Beaudoin and others, 1989). A difference in timing of 31 ms was determined between the USGS and GSC recording and playback systems and was removed. An empirical amplitude scaling factor of 4.7 was calculated and applied to the GSC records. Ground motion can be calculated from recorded seismograms using the method of Dawson and Stauber (1986).

The GSC digital recorders were deployed at sites 541-560 for the Fairbanks North deployment and the -31 ms timing correction was applied to the GSC traces.

**Figure 7.** Comparison of trace normalized seismograms from coincidentally sited USGS and GSC instruments for ARD shot #4, shotpoint #3, (Beaudoin and others, 1989).

## Record Sections

Figures 8-33 are record sections for the Fairbanks North deployment corresponding to shots 29-42. Stations for the Fairbanks North deployment are numbered 501-629. Figures 34-45 are record sections of the Olmes reflection deployment corresponding to shots 44-49. Stations for the Olmes reflection deployment are numbered 901-1019.

In each record section, reduced-travel-time is plotted using the formula:

$$T_r = T_\alpha - (x/6.0)$$

where  $T_r$  is the reduced time,  $T_\alpha$  is the actual recorded time,  $x$  is the shot-to-geophone offset, and  $6.0 \text{ kms}^{-1}$  is the reducing velocity. Location numbers are listed at the top of each trace.

For each shot, both normalized and true-amplitude record sections are presented. In the normalized record sections, each trace has a maximum amplitude of 0.10 inches for copies shown in this report. For true-amplitude record sections the trace amplitude is proportional to the velocity of ground motion as recorded by the seismometer, with a maximum width of 0.10 inches before it is clipped. For display purposes, some noisy traces have been edited in the true-amplitude plots.

The trace amplitude of true-amplitude record sections is calculated using the following formula:

$$A(t) = A_0(t) f_d f_s$$

where  $A_0(t)$  is the observed seismic amplitude at the given station,  $f_d = (x/100)^{1.5}$  is the instrument offset factor, where  $x$  is offset in  $km$ , and  $f_s$  is the shot efficiency factor.

Shot efficiency factors are determined empirically for each shot in order to provide the best display of energy on the true-amplitude record sections (see Table 1). The shot efficiency factors are inversely proportional to the degree of conversion of explosive to seismic energy.

All record sections have been screened for mislocated stations, timing errors, noisy traces, and an attempt was made to recover missing traces. For the Olmes deployment, record sections are also shown in which traveltimes have been corrected for "normal moveout" of reflected energy:

$$T_n = \text{sqr}[T_\alpha^2 - (x/V_n)^2]$$

where  $T_n$  is the normal moveout time,  $T_\alpha$  is the actual arrival time,  $x$  is the shot-receiver distance, and  $V_n$  is an estimated average crustal velocity of 6 km/s.

## ACKNOWLEDGEMENTS

We gratefully acknowledge the assistance in our field work and initial data processing by E. L. Ambos, P. A. Berge, C. Collum, G. Corbin, R. H. Colburn, J. Cotton, E. E. Criley, E. Flueh, L. Green, R. M. Kaderabek, J. H. Luetgert, R. Luzitano, W. M. Kohler, R. McClearn, W. D. Mooney, J. W. Murphy, B. Page, R. A. Page, D. B. Reneau, S. Schapper, J. Shemeta, J. R. VanSchaack, D. Whitman, and J. Wilson. We are indebted to our Canadian colleagues, T. Cote, T. Neufeld, and C. Spencer, for graciously contributing twenty instruments to our experiment, operating the instruments, and reducing the data.

We wish to thank a number of public and private agencies for their generous cooperation and interest in our study. They include the U. S. Forest Service (L. Keeler), U. S. Bureau of Land Management (M. Green, R. Masinton, C. Joy, and B. Bush), U. S. Fish and Wildlife Service (E. Snyder-Conn), U. S. Army (Captain Walters), U. S. Air Force (Captain Heinen), State of Alaska Fish and Game Department (R. McClean), and Alaska Pipeline Service Company (D. Prendeville, and J. Harle). We also wish to thank our colleagues at the University of Alaska at Fairbanks, R. Stone and J. Davies, who kindly allowed us to house our computer at their university. We thank J. M. Murphy and T. Moore for reviews.

## **APPENDIX B**

### **FIELD DATA TABLES**

Field data tables include information related to the seismic recorders. Each table contains shot number, shotpoint number and shot time given in Julian day, hour, minutes and seconds. Column headings for the table are explained below:

<b>Loc</b>	-location number from the seismic recorder location (see Appendix A).
<b>Dist</b>	-distance in kilometers from the shotpoint to the recorder.
<b>Azim</b>	-azimuth from the shotpoint to the recorder (degrees clockwise from north).
<b>Db</b>	-attenuation down from a total gain of 102 decibels.

## APPENDIX C

### ARCHIVE TAPE FORMAT

Archive data tapes are written in SEG Y standard format (Barry and others, 1975). Recording density is 1600 bpi, phase encoded (PE). In order to accomodate seismic refraction data, some minor changes have been made to the tape header fields. A complete list of header fields is provided in the card image portion of the reel identification header, shown below:

**C 1 REEL IDENTIFICATION HEADER BYTES:**

**C 2 3217-3218** sampling interval (microsecs)  
**C 3 3221-3222** number of samples per trace  
**C 4 3225-3226** data sample format code  
**C 5 3255-3256** measurement system (1 = meters; 2 = feet)

**C 6**

**C 7**

**C 8 TRACE IDENTIFICATION HEADER BYTES:**

**C 9 1 - 4** trace sequence number within reel  
**C10 5 - 8** trace sequence number within reel  
**C11 9 - 12** station location number  
**C12 29 - 30** trace ID code (1 = seismic data)  
**C13 37 - 40** shotpoint-receiver distance (M)  
**C14 41 - 44** station elevation (M)  
**C15 45 - 48** shotpoint elevation (M)  
**C16 49 - 52** source depth (M)  
**C17 69 - 70** scalar to be applied to all elevations  
**C18 71 - 72** scalar to be applied to all coordinates  
**C19 73 - 76** shotpoint coordinate, X  
**C20 77 - 80** shotpoint coordinate, Y  
**C21 81 - 84** receiver coordinate, X  
**C22 85 - 88** receiver coordinate, Y  
**C23 89 - 90** coordinate units (1 = meters; 2 = seconds of arc)  
**C24 115 - 116** number of samples in this trace  
**C25 117 - 118** sample interval in microseconds for this trace  
**C26 121 - 122** instrument attenuation in db  
**C27 157 - 158** shot time - year  
**C28 159 - 160** shot time - day of year  
**C29 161 - 162** shot time - hour of day (24 hour clock)  
**C30 163 - 164** shot time - minute of hour  
**C31 165 - 166** shot time - second of minute  
**C32 167 - 168** time basis code (2 = GMT)  
**C33 181 - 182** shot time milliseconds  
**C34 183 - 184** shotpoint location number  
**C35 185 - 186** recording instrument unit number  
**C36 191 - 192** distance weighting exponent (hundredths)  
**C37 193 - 194** shot sequence number (shot number)  
**C38 195 - 196** shot size (kg)  
**C39 197 - 200** shot point - station azimuth (seconds of arc)  
**C40 201 - 204** time of first point minus shot time (msec)

The data point is "32 bit floating point", and the appropriate bytes (3225-3226) of the binary reel id header contain a value of 1. The trace amplitudes have not been adjusted for instrument gain, but the gain correction factor can be estimated from the instrument attenuation value (att) specified in bytes 121-122. To correct for gain, the data should be demeaned and then multiplied by:

$$10^{(att/20)}$$

The measurement system (bytes 3255-3256 of the binary reel header) is set to 1, meters.

Shotpoint and receiver coordinates are in seconds of arc (byte field 89-90). The coordinate scalar multiplier (bytes 71-72) is set to -100, so the coordinates (bytes 73-88) are in hundredths of a second of arc.

Bytes 157-166 and bytes 181-182 refer to the shot detonation time. The time of the first data sample is found by adding the shot detonation time to the time specified in bytes 201-204.

Since there is no weighting of amplitudes with distance for archive tapes, the distance weighting exponent (bytes 191-192) is not used.

Shot sequence number (bytes 193-194) refers to the order in which shots were fired during the field campaign.
