

LEGEND

x Nonproducing well location
Sedimentary Rocks at depths
greater than 15,000 ft.
Scale 1:5,000,000

EXPLANATION

Some of the 2907 wells plotted may have only penetrated rocks identified as undifferentiated lowest Cretaceous and upper Jurassic. Many wells in the Gulf region lacked information on the rocks at total depth and were not plotted. Rocks described only as salt at total depth may or may not have been plotted depending on other geologic information available for the area. The wells plotted may have had gas or oil shows but were not economical to produce at the time they were drilled. The dry (nonproducing) well data was derived from Petroleum Information's Well History Control System files current to June 1991.

Albers equal area projection

NONPRODUCING WELLS IN THE UNITED STATES THAT PENETRATED ROCKS OF
JURASSIC AGE OR OLDER WITH TOTAL DEPTHS GREATER THAN 14,999 FEET
