## CONVERSION FACTORS, VERTICAL DATUM, AND ABBREVIATIONS

<i><u>Multiply</u></i>	<i><u>By</u></i>	<i><u>To obtain</u></i>
foot (ft)	0.3048	meter
inch (in)	25.4	millimeter
pound per square inch (lb/in <sup>2</sup> )	6.895	kilopascal

Sea level: In this report, "sea level" refers to the National Geodetic Vertical Datum of 1929—a geodetic datum derived from a general adjustment of the first-order level nets of the United States and Canada, formerly called Sea Level Datum of 1929.

Water year: Water year is the 12-month period of October 1 through September 30. The water year is designated by the calendar year in which it ends; thus, the water year ending September 30, 1992, is called the "1992 water year."

lsd	land-surface datum
mp	measuring point

# **WATER LEVELS THROUGH 1989 IN BEDROCK AQUIFERS IN SOUTH DAKOTA**

**By Douglas R. Winter**

## **ABSTRACT**

This report summarizes water-level data for 237 wells completed in bedrock aquifers throughout South Dakota. The water levels are presented in hydrographs in the main body of the report and in tables in a Supplemental Information section at the end of the report. The data are organized by county, in alphabetical order.

## **INTRODUCTION**

This report on water levels in bedrock aquifers in South Dakota is the result of a continuing investigation by the U.S. Geological Survey in cooperation with the South Dakota Department of Environment and Natural Resources. Data included are from 1959 through 1989. The purpose of the investigation was to collect data on the water supply in the bedrock aquifers and to present these data in reports that would aid in planning the use and conservation of water from these aquifers. The locations of wells where data have been collected are shown in figure 1.

Data collected prior to water year 1981 also are reported in U.S. Geological Survey Open-File Report 81-627; data collected after water year 1989 will be published in future reports. For additional information, please contact the District Chief, U.S. Geological Survey in Rapid City, South Dakota.

## **WELL- AND SITE-NUMBERING SYSTEM**

The wells are numbered according to a system based on the Federal land survey of South Dakota (fig. 2). The well number consists of the township number followed by "N" or "S," the range number followed by "W" or "E," and the section number, followed by a maximum of four uppercase letters that indicate, respectively, the 160-, 40-, 10-, and 2 1/2-acre tract in which the well is located. These letters are assigned in a counter-clockwise direction beginning with "A" in the northeast quarter. A serial number following the last letter is used to distinguish between wells in the same tract. Thus, well 109N61W6BAAC (fig. 2) is the well in the SW1/4, NE1/4, NE1/4, NW1/4, sec. 6, T. 109 N., R. 61 W. If an "R" follows the number, it means that the well is on an Indian reservation.

The site-numbering system of the U.S. Geological Survey is based on the international system of latitude and longitude. The number contains 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude north of the equator. The next seven digits denote degrees, minutes, and seconds of longitude west of the prime (Greenwich) meridian. The last two digits are sequential numbers for wells within the same 1-second block. These systems provide the geographic location of the well and a unique number for each well.

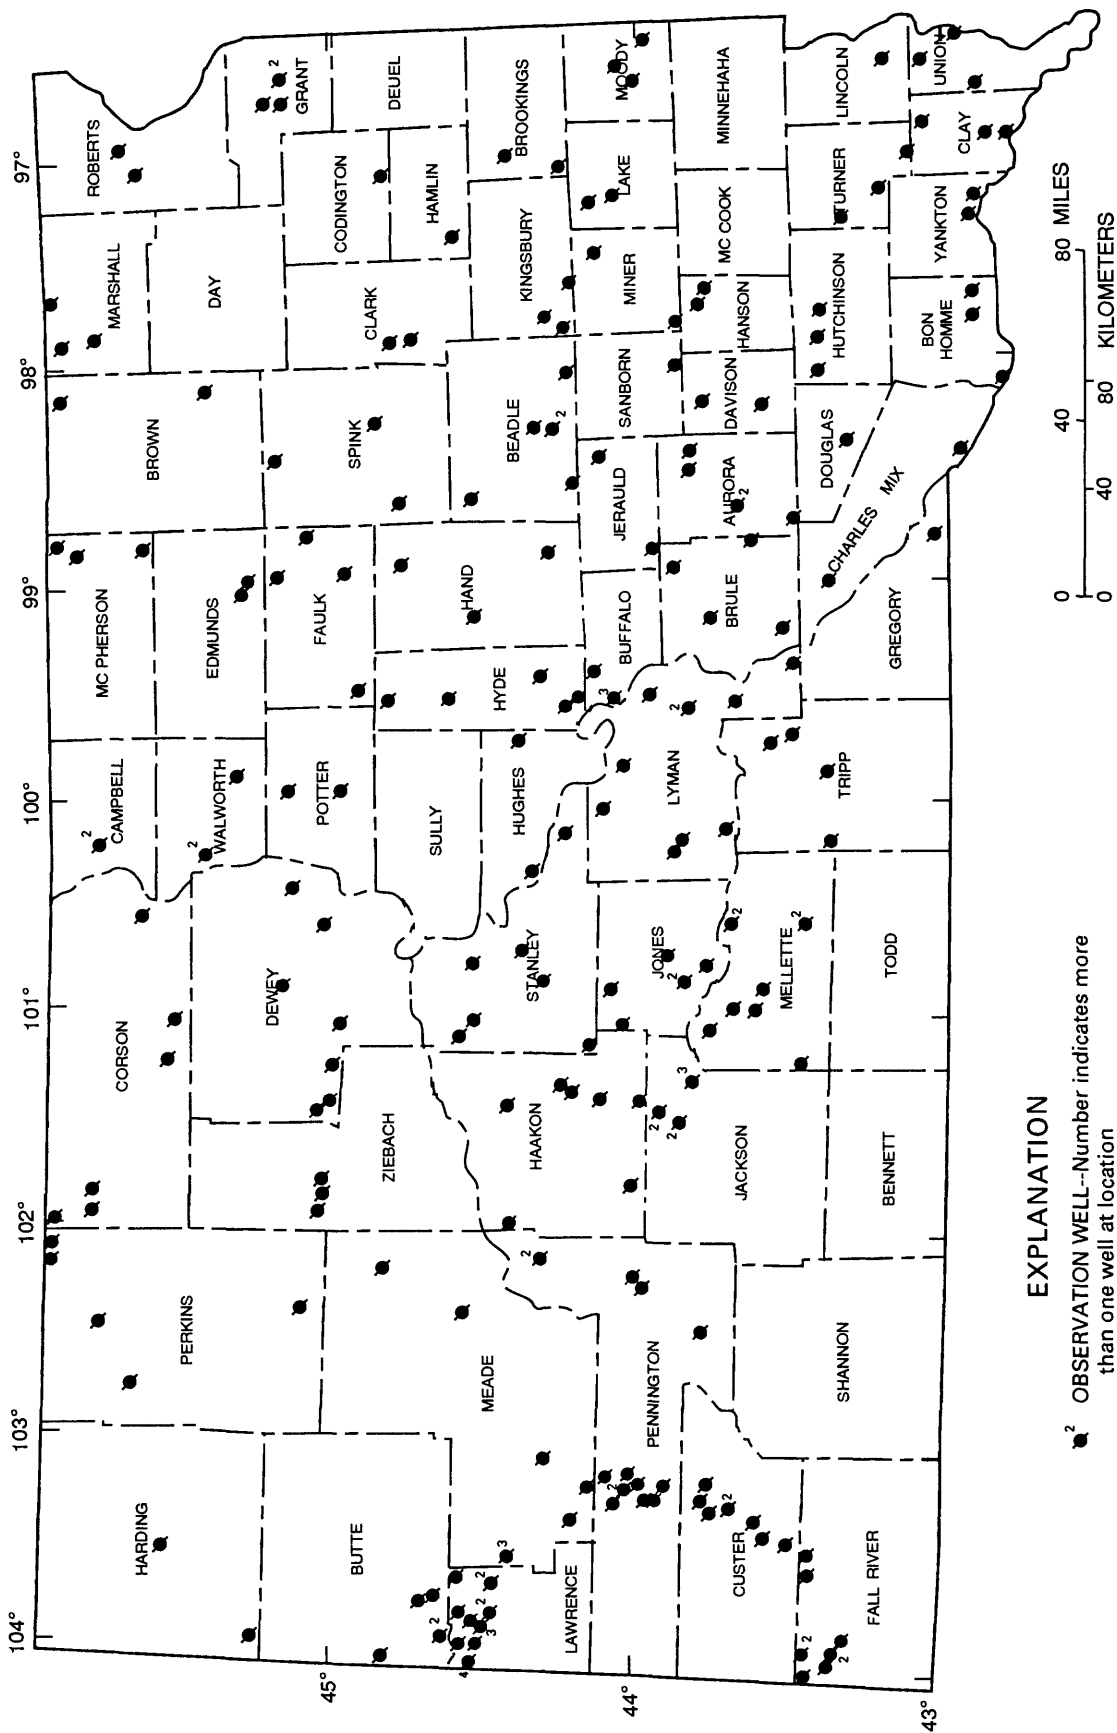

Figure 1.--Location of selected observation wells in bedrock aquifers.

Figure 2.--Well-numbering diagram.

## **WATER-LEVEL MEASUREMENTS**

Water-level measurements in this report are given in feet with reference to land-surface datum. Land-surface datum is a datum plane that is approximately at land surface at each well. The height of the measuring point above or below land-surface datum is given in each well description. If known, the altitude of the land-surface datum, referenced to sea level, is given in the well description.

Measurements were made in many types of wells, under varying conditions of access, and at different temperatures; therefore, neither the method of measurement nor the equipment used could be standardized. However, the equipment and techniques used at each observation well ensured that measurements were consistent. A large number of these observation wells are privately owned and are production wells; therefore, it was impossible to be consistent with shut-in or recovery time before each measurement. Water levels for some measurements may reflect a varied recovery time from year to year.

Water levels are reported to as many significant figures as can be justified by the local conditions. For example, in a measurement of depth to water of several hundred feet, the error in determining the absolute value of the total depth to water may be a few tenths of a foot, whereas the error in determining the net change of water level between successive measurements may be only a hundredth or a few hundredths of a foot. For lesser depths to water, the accuracy is greater.

For flowing wells, measurements were made with a pressure gage calibrated in pounds per square inch. Pressure in pounds per square inch was converted to feet of water above land-surface datum by using the conversion factor 2.307 feet of water per pound of pressure per square inch. The resulting value was then rounded to the nearest tenth of a foot.

## **HYDROGRAPHS**

A hydrograph is presented following the local well number, site identification number, remarks, and water-level extremes for each well. Water levels, in feet above (+) or below land surface, are shown on the left side of the hydrograph and are marked by horizontal grid lines. Most wells were measured once a year. Generally, when the interval between water-level measurements was greater than 1 year, the hydrograph is dashed. A few wells, as noted in the appropriate hydrograph headings, were equipped with continuous water-level recorders for part or all of the period of record. A water-level table for each well is presented in the Supplemental Information section at the end of the report.

Selected bedrock units in South Dakota and their relative ages and stratigraphic positions, with the youngest, and stratigraphically highest, at the top and the oldest and stratigraphically lowest at the bottom, are listed in table 1. The units only partially underlie the State, with the exception of igneous and metamorphic rocks, which underlie all of South Dakota.

**Table 1.--Selected bedrock units in South Dakota**

Period	Group	Formation	
Tertiary		Arikaree Formation	
	White River Group		
		Fort Union Formation	Tongue River Member
			Cannonball Member
			Ludlow Member
Cretaceous	Montana Group	Hell Creek Formation
