

Explanation

- Sand and Gravel Potential**
- No potential for significant sand and gravel.
 - Favorable
Fair to Good - Gravel, sand, and silt; relatively well sorted, unweathered, and unconsolidated.
 - Permissive
Fair to Poor - Silt, sand, gravel; poorly sorted, weathered, and/or partly consolidated.
 - Permissive
Streams - From 1:2M source
 - Permissive
Sand Only - Dune or wind blown sand.
 - Town site within interior Columbia River basin. Area is proportional to population.
 - Areas of high demand within interior Columbia River basin. Near towns of greater than 20,000 residents. Area is proportional to population.

Patterns of distribution of surficial sedimentary units that contain sand and gravel are derived from Ross and others (1955), Hunting and others (1961), Jennings (1977), Bond and Wood (1978), Stewart and Carlson (1978), Hintze (1980), Love and Christiansen (1985), and Walker and MacLeod (1991). Locations of rivers are from U.S. Geological Survey (1995).
