ABBREVIATED WATER-QUALITY UNITS

Chemical concentration and water temperature are given only in metric units. Chemical concentration in water is given in milligrams per liter (mg/L) or micrograms per liter (µg/L). Milligrams per liter is a unit expressing the solute mass (milligrams) per unit volume (liter) of water. One thousand micrograms per liter is equivalent to 1 milligram per liter. For concentrations less than 7,000 milligrams per liter, the numerical value is about the same as for concentrations in parts per million. Specific conductance is given in microsiemens per centimeter (µS/cm) at 25°C. Chemical concentration in bottom sediment is given in grams per kilogram (g/kg), micrograms per gram (µg/g), milligrams per kilogram (mg/kg), or micrograms per kilogram (µg/kg). Grams per kilogram is equal to parts per thousands (ppt). Milligrams per kilogram and micrograms per gram are equal to parts per million (ppm). Micrograms per kilogram are equal to parts per billion (ppb).

VERTICAL DATUM

By John J. Rote, Marilyn E. Flynn, and Donald J. Bills

Abstract

The U.S. Geological Survey collected hydrologic data at 12 continuous-record stations along the Colorado River and its major tributaries between Glen Canyon Dam and Diamond Creek. The data were collected from October 1989 through September 1995 as part of the Bureau of Reclamation's Glen Canyon Environmental Studies. The data include daily values for streamflow discharge, suspended-sediment discharge, temperature, specific conductance, pH, and dissolved-oxygen concentrations, and discrete values for physical properties and chemical constituents of water. All data are presented in tabular form.

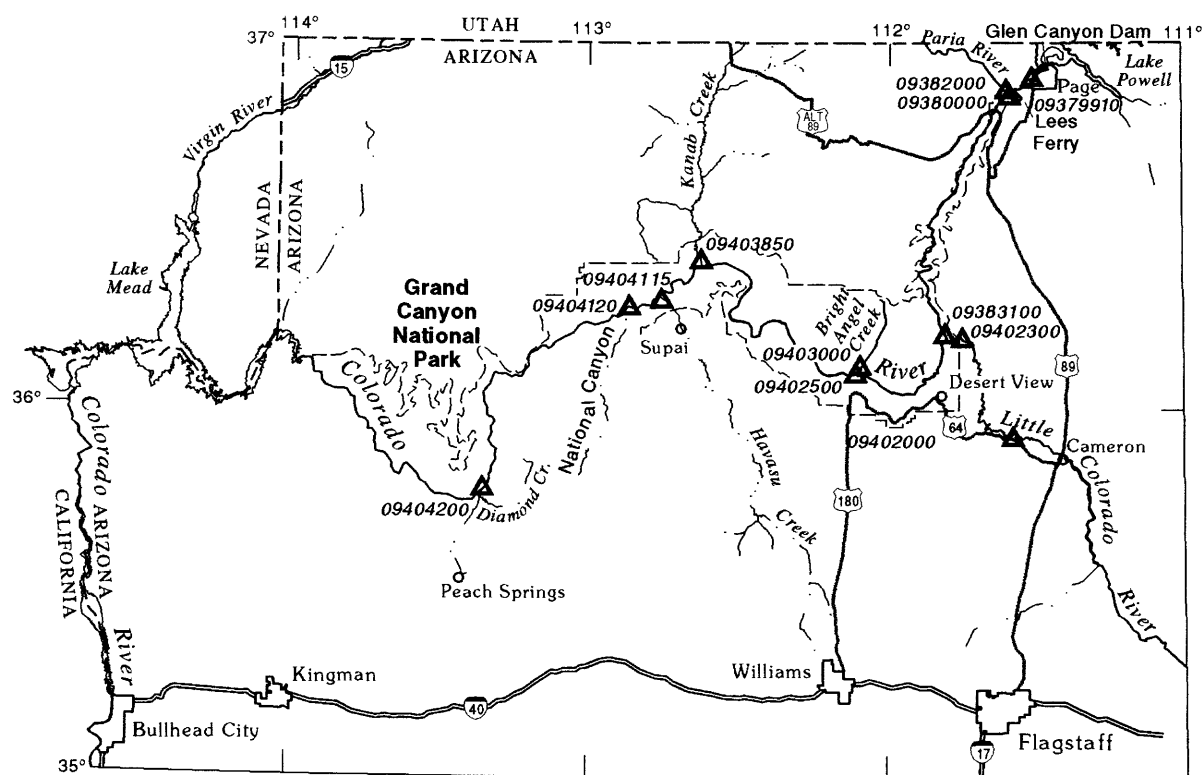

INTRODUCTION

The Colorado River, which originates in Colorado, flows about 1,400 mi through portions of five western States to the Gulf of California. The Colorado drains a large area of the arid West where water is an important resource. The management of this resource has resulted in the placement of many controls on the river for power production and irrigation. Currently 13 reservoirs are on the Colorado River and its tributaries. The newest reservoir, Lake Powell, was formed after the completion of Glen Canyon Dam in 1963 (fig. 1).

Downstream from Lake Powell, the Colorado River flows through Glen, Marble, and Grand Canyons, which provide habitat for several endangered species as well as being popular scenic and recreational areas. The completion of Glen Canyon Dam in 1963 and the filling of Lake Powell in 1980 changed the behavior and characteristics of the Colorado River below the dam.

In 1982, the Bureau of Reclamation (BOR) began Phase I of the Glen Canyon Environmental Studies (GCES), to determine the effects of dam

operations on the downstream riverine environment. The U.S. Geological Survey (USGS) collected streamflow and sediment-transport data during this first phase (Garrett and others, 1993). During Phase I, unexpected floodflows in 1983, 1984, 1985, and 1986 prevented adequate study of flows typical of the dam's powerplant operating criteria. After a review of Phase I by the National Academy of Science, the U.S. Department of the Interior directed that further studies be done. Phase II of the GCES program was initiated in 1989 to collect and analyze additional physical, chemical, and biological information. The USGS, in cooperation with the BOR, began to collect various hydrologic data in 1989. As of 1996, the USGS continues to monitor, collect, and evaluate hydrologic data from the Colorado River below Glen Canyon Dam. This report presents hydrologic data collected from October 1989 through September 1995 at 12 continuous-record stations (fig. 1) along the main stem of the Colorado River and its major tributaries between Glen Canyon Dam and Diamond Creek.

Acknowledgments

The data in this report are a direct result of the collaboration of several agencies and many individuals. The staff of Grand Canyon National Park assisted with access to data-collection sites, data collection, and equipment repair. The staff also responded in a timely manner to unusual flow events during the course of this study. OARS, Inc., operated the rafts and provided food and field support. The professionalism and support of the boatmen and cooks created a comfortable work environment under primitive conditions. Many volunteers donated their time and talents to provide crucial support in the collection of this data.

Description of the Study Area

The study area includes the Colorado River and its major tributaries between Glen Canyon Dam and Diamond Creek. Diamond Creek, which is at the downstream end of the study area, joins the Colorado River about 225 mi downstream from Glen Canyon Dam. The study area contains about 242 river miles and includes parts of Glen Canyon National Recreational Area and Grand Canyon National Park (fig. 1). The Colorado River originates in Colorado and has a drainage area of about 250,000 mi² at its mouth at the Gulf of California. Water is released from the upper Colorado River Basin (Colorado, Wyoming, New Mexico, and Utah) to the lower Colorado River Basin (Arizona, Nevada, and California) at Glen Canyon Dam on Lake Powell. The Colorado River Compact of 1923 requires by law that at least 8.23 million acre-ft/yr be released to the lower basin.

For much of its length through the Grand Canyon, the Colorado River is confined by bedrock, large blocks of talus, or by alluvial debris that is too coarse to be transported except during high flows. Flow depths in the thalweg range from about 5 to 105 ft at a discharge of 25,000 ft³/s. Depths can change abruptly, and there are near-vertical drops of as much as 50 ft in gorges formed in the metamorphic and igneous rock (Wilson, 1986).

Climate in the study area is typical of the arid plateaus in deserts of the western United States with hot, dry summers and dry winters. Daily temperatures can range from below freezing in the

winter to over 100°F during the summer. Annual precipitation ranges from 6 to 25 in. (J.P. Bennett, hydrologist, USGS, written commun., 1990).

In the study area, tributaries to the Colorado River can be categorized as those that originate outside the inner canyon and drain large plateau areas and those that originate within the canyon. The Paria River, Little Colorado River, Kanab Creek, and Havasu Creek originate outside the inner canyon and are the major drainage features between Glen Canyon Dam and Diamond Creek. The Paria and Little Colorado Rivers account for most of the suspended sediment in the Colorado River in this reach. Tributaries that have drainage basins largely within the inner canyon transport sediment as debris flows and appear to be the primary mechanism for the distribution of rapids on the Colorado River (Cooley and others, 1977; Howard and Dolan, 1981; Webb and others, 1989).

Hydrologic Conditions

Before Glen Canyon Dam was constructed, the Colorado River in the Grand Canyon had highly variable discharge and suspended-sediment concentration and a high seasonal variation in water temperature (figs. 2–4). During late spring and summer, the melting of the snowpack in the Rocky Mountains commonly produced annual maximum daily flows of about 80,000 ft³/s. In contrast, flows of about 3,000 ft³/s were typical throughout late summer, fall, and winter. High flow from spring snowmelt and thunderstorms produced flash floods from tributaries or side canyons and had the potential to cause dramatic changes in flow for intervals of a few days or less. Suspended-sediment discharge increased during the spring runoff and again in late summer as a result of tributary floods. Annual suspended-sediment load at Lees Ferry was 65.4 million tons during 1948–62 (Garrett and others, 1993). Water temperatures ranged from near freezing in winter to more than 26°C in late summer (Bureau of Reclamation, 1995).

During the period of filling of the reservoir (1963–80), flow remained within powerplant capacity (33,100 ft³/s) except for 49 days during April, May, and June 1965. Average annual peak discharge during 1963–80 was about 29,000 ft³/s.

Figure 4. Daily water temperature at streamflow-gaging station, Colorado River at Lees Ferry (station number 09380000), 1949–77. Temperature values represent instantaneous measurements made once a day.

Postdam-flow regulation has replaced seasonal-flow variations and daily fluctuations by reducing the frequency of discharges that were greater than powerplant capacity and increasing the range and rate of change of discharge during each day. Dam releases through the powerplant can range from 1,000 to 33,200 ft³/s daily (fig. 5). River temperatures also have been lowered significantly by the release of cold water from deep in the lake. Temperatures at Lees Ferry ranged from approximately 7° to 16°C during 1977–95 (fig. 6). Lake Powell functions as a sediment trap and has reduced annual sediment load at Lees Ferry from 65.4 million tons during 1948–62 to an estimated 0.4 million tons during 1982–86 (Garrett and others, 1993). As of 1996, the suspended-sediment load of the Colorado River is derived primarily from the Paria and Little Colorado Rivers, which supplied only about 10 percent of the sediment load before the dam was built.

Reservoir releases designed and recommended by the GCES scientists were implemented in 1990 and 1991 (fig. 7) and are closely reflected in the measured flows at the continuous-record station at Colorado River at Lees Ferry (fig. 8). On the basis of information collected and analyzed during this

period, a set of interim operating regulations for the dam was adopted and was to be used until the final Environmental Impact Statement (EIS) on dam operation could be completed. Operating regulations were defined on the basis of meeting the annual release requirements, maximum and minimum discharge rates, total change of discharge per day, and rate of change of discharge within a given day (fig. 9). These regulations were implemented on November 1, 1991, and are being used as of 1996.

In addition to flow release from the dam, the Colorado River in the Grand Canyon received significant inflow from the Little Colorado River in 1993, and Havasu Creek in 1990, 1991, and 1993. In January 1993, the Little Colorado River watershed received 572 percent of normal precipitation, and the runoff recorded at the station at the Little Colorado River near Cameron exceeded the 100-year floodflow volume for January by 68 percent. The magnitude of the high inflow is illustrated by comparing the discharge at two continuous-record stations upstream and downstream from the confluence of the Colorado River and the Little Colorado River (fig. 10).

DATA COLLECTION

The gaging network consisted of 12 continuous-record stations on the main stem of the Colorado River and major tributaries of the Colorado River. All sites monitored during Phase I of the GCES study were included in the network (Garrett and others, 1993). All sites consisted of

instrumentation to measure and record stage and some physical and chemical characteristics of the water (temperature, pH, specific conductance, and dissolved-oxygen concentration). Samples were collected and analyzed for suspended-sediment concentration and grain-size distribution at most sites. Daily total sediment and sand loads were computed only for samples collected at Little Colorado River near Cameron when the daily

discharge exceeded 20 ft³/s and at Paria River at Lees Ferry when the daily discharge exceeded 30 ft³/s. Station names and identifications, river-mile locations, data-collection periods, drainage areas, instrumentation, and types of collected data for the continuous-record sites are given in table 1.

Physical and chemical data were collected at several sites during the constant flow of 5,000 ft³/s in October 1989 and at the continuous-record stations (table 1) during site visits. Most of the data in this report were collected using standard methods of the USGS. Methods for collection, examination, and computation of records of discharge, sediment, and water chemistry, and methods of identifying data-collection sites are described by Smith and others (1995).

INSTRUMENTATION

The stage at continuous-record stations was sensed by a float-driven shaft encoder or by a nonsubmersible pressure transducer driven by a nitrogen gas-feed system. River stage then was recorded from these devices by various instruments. Except for the stations at Little

Colorado River above the mouth near Desert View and Havasu Creek above the mouth near Supai, the primary source of stage for all stations was received by telemetry using data-collection platforms (DCP's). A duplicate backup record was collected using dataloggers and analog strip-chart recorders. Telemetry data were transmitted at 4-hour intervals, and a backup record was retrieved when the gaging station was serviced. Instantaneous stage readings were collected at 15- or 30-minute intervals from which discharge was determined from a stage-discharge rating table. Stage-discharge ratings were verified by routine measurements of discharge using current meters.

Minimonitors and (or) automated-pumping samplers were used to monitor physical and chemical characteristics of water. Minimonitors were used to monitor pH, water temperature, specific conductance, and dissolved-oxygen concentration. DCP's recorded and transmitted constituent values and stage data. Analog digital recorders (ADR's) provided duplicate a backup record. Minimonitor instrumentation was discontinued in 1993 except for collection of water temperature and specific conductance at Colorado River at Lees Ferry. Monitoring of water temperature also was continued at Colorado River

above Little Colorado River and at Havasu Creek. In these cases, thermistors were wired directly to dataloggers for sensing and recording. Instantaneous readings at all sites were collected on 1-hour intervals. Suspended-sediment samples were collected by automatic-pumping samplers for concentration and grain-size analysis. Samplers were activated by DCP's or dataloggers on the basis of site-specific time and stage criteria.

Water samples were collected at the continuous-record stations during October 1989 and during routine site visits by field personnel. Samples were analyzed for alkalinity, dissolved-oxygen concentration, pH, specific conductance, and water temperature on-site and for specific chemical constituents at the USGS National Water-Quality Laboratory in Denver, Colorado. Suspended-sediment samples were

analyzed at the USGS Sediment Laboratory in Vancouver, Washington, and Iowa City, Iowa. Standard methods were used to collect, treat, and analyze the samples (L.R. Kister, hydrologist, USGS, written commun., 1983).

DATA TABLES

Data for the continuous-record stations are presented in tables 2 through 13 at the back of the report. Daily mean discharge for continuous-record stations on the main stem of the Colorado River were estimated for periods of no gage-height record. Discharge for tributary stations is presented for days with complete gage-height record; no attempt was made to estimate discharge for periods of no gage-height record. Physical-property and

STATION DESCRIPTION

LOCATION—Lat 36°51'53", long 111°35'15", in NE1/4, SE1/4, sec. 13, T.40 N., R.7 E., Coconino County, Hydrologic Unit 14070006, in Navajo Indian Reservation, on left bank at head of Marble Gorge at Lees Ferry, just upstream from Paria River, 16 mi downstream from Glen Canyon Dam, 28 mi downstream from Utah-Arizona State line, and 61.5 mi upstream from Little Colorado River.

DRAINAGE AREA—Approximately 111,800 mi² including 3,959 mi² in Great Divide Basin in southern Wyoming, which is noncontributing.

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—January 1895 to current year. Estimates of monthly and annual discharge only for some periods, published in WSP I313.

GAGE—Water-stage recorder. Datum of gage is 3,106.16 ft above sea level. Prior to January 19, 1923, nonrecording gages or reference points within 400 ft of present gage, at different datums.

REMARKS—No estimated daily discharge. Records good. Flow regulated since March 13, 1963, by Lake Powell, 16 mi upstream. Many diversions above Lake Powell for irrigation, municipal, and industrial use. No diversions or inflow between Lake Powell and the gage.

EXTREMES FOR PERIOD OF RECORD—1895–1962: Maximum discharge, 220,000 ft³/s, June 18, 1921; gage height, 26.5 ft, from floodmarks and from rating curve extended above 120,000 ft³/s on basis of discharge computed for station near Grand Canyon; minimum daily discharge, 750 ft³/s, December 27, 1924.

1963–93: Maximum discharge, 97,300 ft³/s, June 29, 1983, gage height, 18.14 ft; minimum daily discharge, 700 ft³/s, January 23 and 24, 1963, was the result of closure of coffer dam at Glen Canyon Dam.

EXTREMES OUTSIDE PERIOD OF RECORD—Maximum discharge since at least 1868, about 300,000 ft³/s, July 7, 1884, gage height, 31.5 ft, present site and datum from floodmark at mouth of Paria River and from rating curve extended above 120,000 ft³/s on basis of discharge computed for flood of June 18, 1921, for station near Grand Canyon.

EXTREMES FOR DATA PERIOD—Maximum discharge, 29,500 ft³/s, July 31, 1990, and June 17, 1991, gage height, 11.95 ft; minimum daily discharge, 3,040 ft³/s, October 29, 1989.

STATION DESCRIPTION

LOCATION—Lat 36°52'20", long 111°35'38", in NW1/4NE1/4 sec. 13, T.40 N., R.7 E., Coconino County, Hydrologic Unit 14070007, on left bank 0.6 mi northwest of Lees Ferry, and 1.1 mi upstream from mouth.

DRAINAGE AREA—1,410 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—October 1923 to current year.

GAGE—Water-stage recorder. Datum of gage is 3,123.68 ft above sea level. Prior to October 5, 1925, nonrecording gage at site 2,000 ft upstream at different datum. October 13, 1925, to September 11, 1929, nonrecording gage at present site and datum.

REMARKS—Records fair except for estimated daily discharges, which are poor. Diversions above station for irrigation of about 3,300 acres, which are mostly in southern Utah.

EXTREMES FOR PERIOD OF RECORD—Maximum discharge, 16,100 ft³/s, October 5, 1925, gage height, 16.3 ft, from floodmark and from rating curve extended above 2,000 ft³/s on basis of float-area measurement of peak flow; maximum gage height, 16.65 ft, September 9, 1980; minimum daily discharge, 1 ft³/s in most years prior to 1931.

EXTREMES FOR DATA PERIOD—Peak discharges greater than base discharge of 1,400 ft³/s or maximum for year:

STATION DESCRIPTION

LOCATION—Lat 36°12'08", long 111°48'59", Coconino County, Hydrologic Unit 15010001, in Grand Canyon National Park, on the right bank 0.2 mi upstream from the confluence with the Little Colorado River, 11 mi east-northeast of Desert View, 77.1 mi downstream from Glen Canyon Dam, and 293 mi upstream from Hoover Dam.

DRAINAGE AREA—Approximately 114,272 mi², including 3,959 mi² in Great Divide Basin in southern Wyoming and 108 mi² on the Paria Plateau, which is noncontributing.

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—June 1983 to December 1983, September 1985 to February 1986, September 1989 to April 1993, and July 1993 to current year.

GAGE—Water-stage recorder on right bank. Elevation of gage is 2,686.74 ft above sea level from GPS levels. Prior to September 1989, recording gages and reference points within 100 ft of present gage at different datum.

REMARKS—Records fair. Periods of estimated daily discharge are calculated using a flow model, which routed discharge from 09380000, Colorado River at Lees Ferry. Flow regulated since March 13, 1963, by Lake Powell, which is 77.1 mi upstream. At times, gage is affected by backwater caused by tributary Little Colorado River on the left bank just downstream from gage.

EXTREMES FOR PERIOD OF RECORD—Maximum discharge, 96,200 ft³/s, June 29, 1983, gage height, unknown; minimum daily discharge, 3,100 ft³/s, October 30, 1989.

EXTREMES FOR DATA PERIOD—Maximum discharge, 29,800 ft³/s, June 20, 1991, gage height, 33.90; minimum daily discharge, 3,100 ft³/s, October 30, 1989.

STATION DESCRIPTION

LOCATION—Lat 35°55'35", long 111°34'00", in NW1/4 sec. 5, T.29 N., R.8 E. (unsurveyed), Coconino County, Hydrologic Unit 15020016, in Navajo Indian Reservation, on left bank, 3 mi downstream from Coconino dam site, 9.5 mi downstream from Moenkopi Wash, 9.5 mi northwest of Cameron, and 45 mi upstream from mouth.

DRAINAGE AREA—26,459 mi², of which 368 mi² are noncontributing.

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—June 1947 to current year.

GAGE—Water-stage recorder. Datum of gage is 3,979.2 ft above sea level.

REMARKS—Records fair except for estimated daily discharges, which are poor. Diversions above station for irrigation of about 32,000 acres. Some regulation by reservoirs above station (combined capacity of principal reservoirs, about 135,000 acre-ft).

EXTREMES FOR PERIOD OF RECORD—Maximum discharge, 24,900 ft³/s, January 21, 1952, gage height, 20.7 ft; no flow at times in each year.

EXTREMES OUTSIDE PERIOD OF RECORD—A discharge of about 120,000 ft³/s occurred on September 19 or 20, 1923, based on discharge at Grand Falls.

EXTREMES FOR DATA PERIOD—Peak discharges greater than base discharge of 4,000 ft³/s or maximum for year:

STATION DESCRIPTION

LOCATION—Lat 36°11'29", long 111°45'18", Coconino County, Hydrological Unit 15020016, in the Grand Canyon National Park, on the left bank about 0.75 mi upstream of the mouth, 62 mi west southwest of Lees Ferry, about 55 mi downstream from Cameron, and about 11 mi east northeast from Desert View.

DRAINAGE AREA—26,946 mi².

WATER DISCHARGE RECORDS

PERIOD OF RECORD—May 1990 to July 1990 at a site about 2,500 ft downstream, August 1990 to January 1993.

GAGE—Datalogger and pressure transducer. Datum of gage is 2745.00 ft above sea level. Prior to August 1, 1990, on the right bank about 2,500 ft downstream at a datum 25 ft lower.

REMARKS—Records good for daily discharge less than 500 ft³/s. Estimated discharge and daily discharge greater than 500 ft³/s are poor. Diversions above the station for irrigation of about 32,000 acres. Some regulation by reservoirs; combined capacity of the principal reservoirs about 135,000 acre-ft.

EXTREMES FOR PERIOD OF RECORD—Maximum discharge, see 09402000, Little Colorado River near Cameron; gage height, unknown; minimum daily discharge, 194 ft³/s, March 1, 1991.

STATION DESCRIPTION

LOCATION—Lat 36°06'05", long 112°05'08", in sec. 5, T. 31 N., R. 3 E. (unsurveyed), Coconino County, Hydrologic Unit 15010001, in Grand Canyon National Park, on left bank 0.2 mi upstream from Kaibab Bridge, 0.4 mi upstream from Bright Angel Creek, 4.5 mi northeast of village of Grand Canyon, 26 mi downstream from Little Colorado River, and 267 mi upstream from Hoover Dam.

DRAINAGE AREA—Approximately 141,600 mi², including 3,959 mi² in Great Divide Basin in southern Wyoming, which is noncontributing.

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—October 1922 to current year. Prior to 1944, published as "Colorado River at Bright Angel Creek, near Grand Canyon." Gage-height records collected 1.5 mi downstream 1908–13 and published in reports of U.S. Weather Bureau.

GAGE—Water-stage recorder with supplementary water-stage recorder on right bank, 700 ft downstream (prior to October 1, 1934, supplementary gage was the only gage). Datum of both gages is 2,418.7 ft above sea level.

REMARKS—Records good. Flow completely regulated by Lake Powell, which is 104 mi upstream, since March 13, 1963. Many diversions above station for irrigation, municipal, and industrial uses.

EXTREMES FOR PERIOD OF RECORD—1922–62: Maximum discharge, 127,000 ft³/s, July 2, 1927, gage height, 29.25 ft; minimum daily discharge, 700 ft³/s, December 28, 1924, gage height, -0.70 ft. 1963–95: Maximum discharge, 96,200 ft³/s, June 29, 1983, gage height, 26.26 ft; minimum daily discharge, 850 ft³/s, January 26, 1963, gage height, -0.55 ft, result of closure of coffer dam at Glen Canyon Dam.

EXTREMES OUTSIDE PERIOD OF RECORD—Maximum discharge since at least 1884, 300,000 ft³/s about July 8, 1884 (computed on basis of flood studies at Lees Ferry). Crest discharge of flood of June 19, 1921, was 220,000 ft³/s, gage height, 37.5 ft, from floodmarks and from rating curve extended above 120,000 ft³/s.

EXTREMES FOR DATA PERIOD—Maximum discharge, 34,100 ft³/s, January 13, 1993, gage height, 15.44 ft; minimum daily discharge, 4,050 ft³/s, October 30, 1989.

STATION DESCRIPTION

LOCATION—Lat 36°06'11", long 112°05'44", in sec. 5, T.31 N., R.3 E. (unsurveyed), Coconino County, in Grand Canyon National Park, on right bank 0.4 mi, upstream from mouth, and 4 mi northeast of Grand Canyon.

DRAINAGE AREA—101 mi².

WATER-DISCHARGE RECORDS

PERIOD OF RECORD—October 1923 to March 1974, and October 1990 to April 1993 (discontinued).

GAGE—Water-stage recorder. Zero datum of gage is 2,499.07 ft above sea level (National Park Service bench mark). Nonrecording gages at several sites within 3,200 ft of the mouth at various datums, October 20, 1923, to January 29, 1933, and August 25, 1936, to April 21, 1943. Water-stage recorder, 1,400 ft downstream from present site at datum 35.5 ft lower, January 30, 1933, to August 19, 1936. Water-stage recorder, 1,600 ft downstream from present site at datum 40.0 ft lower, April 22, 1943, to May 22, 1968. Nonrecording gage, 100 ft downstream from present site at datum 4.56 ft higher, November 14, 1968, to July 18, 1971. Nonrecording gage and crest-stage gage, 100 ft downstream from present site at datum 2.45 ft higher, July 19, 1974, to March 31, 1974.

REMARKS—Records poor. Diversion above station at Roaring Springs for municipal supply at Grand Canyon Village; excess supply during pumping hours and diversion of supply during nonpumping hours flows into Garden Creek, which is another tributary of the Colorado River.

AVERAGE DISCHARGE—35 ft³/s, 1923–73.

EXTREMES FOR PERIOD OF RECORD—Maximum discharge, 4,400 ft³/s, August 19, 1936, from rating curve extended above 250 ft³/s on basis of slope-area measurement of peak flow; minimum daily discharge, 10 ft³/s, September 28 to October 1, 1961, and September 11 and 13, 1992.

EXTREMES FOR DATA PERIOD—Maximum discharge, 424 ft³/s, January 8, 1993, gage height, 4.90 ft; minimum daily discharge, 10 ft³/s, September 11 and 13, 1992.
