

Figure 1. Map showing approximate water-level altitudes in the Chicot aquifer, Fort Bend County and adjacent areas Texas, January-February 1992.

INTRODUCTION

This report depicts annual water-level altitudes for 3 consecutive years in the Chicot and Evangeline aquifers in Fort Bend County and adjacent areas, Texas. The report, prepared in cooperation with the Fort Bend Subsidence District, presents maps for the Chicot and Evangeline aquifers showing the approximate water-level altitudes in wells in 1992 (figs. 1, 4), 1993 (figs. 2, 5), and 1994 (figs. 3, 6). The most recent previously published water-level-altitude maps (and water-level-change maps) for the two aquifers are by Coplin and others (1997). The earliest water-level-altitude maps (and water-level-change maps) for the Chicot aquifer are by Wesselman (1972). The first maps of water-level altitudes (and water-level changes) for the Chicot and Evangeline aquifers are by Locke (1990).

GEOHYDROLOGY

The Chicot aquifer consists of sediments of Holocene and Pleistocene age, and the underlying Evangeline aquifer consists of sediments of Pliocene and Miocene age. The sediments of the Chicot aquifer are sand and clay. In most of Fort Bend County, the Evangeline aquifer is composed of sand. The basis for differentiation of the Chicot and Evangeline aquifers in Fort Bend County is differences in stratigraphic position, lithology, and hydraulic conductivity (Wesselman, 1972, p. 9, p. 16). A weak hydraulic connection between land surface and the Chicot aquifer and between the Chicot and Evangeline aquifers allows vertical movement of water into and between the aquifers; the aquifer system thus is characterized as "leaky" (Gabrysch and Coplin, 1990, p. 2).

WATER-LEVEL MEASUREMENTS

Water-level measurements used to prepare this report were obtained by steel tape, airline, electronic sensor, and from reports by well operators. Most wells are pumped once daily, but some are pumped more frequently. Multiple measurements were made when wells were not being pumped. However, antecedent pumping conditions were not always known. Water-level measurements were made in January and February, the months when water levels usually are highest. The wells selected for water-level measurements had comparable depths and screened intervals. Some water-level measurements from wells outside the study area are obtained to increase water-level-contour control.

VERTICAL DATUM

Sea level: In this report, "sea level" refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)—a geodetic datum derived from a general adjustment of the first-order level nets of the United States and Canada, formerly called Sea Level Datum of 1929.

EXPLANATION

- 50--- Water-level contour—Shows altitude at which water level would have stood in tightly cased well. Contour interval 50 feet. Datum is sea level
- Boundary of study area
- o Data point—Well in which water-level measurement was made. One point can represent more than one well
