Conversion Factors and Abbreviations

Multiply	By	To obtain
inch (in.)	2.54	centimeter
foot (ft)	0.3048	meter
square mile (mi ²)	2.590	square kilometer
cubic foot per second (ft ³ /s)	0.02832	cubic meter per second
gallon (gal)	3.785	liter

The following terms and abbreviations are used in this report:

m² square meter
mm millimeter
μm micrometer

Temperature is given in degrees Celsius (°C) which can be converted to degrees Fahrenheit (°F) as follows:

$$^{\circ}\text{F} = 1.8 \times ^{\circ}\text{C} + 32$$

Sea Level: In this report, "sea level" refers to the National Geodetic Vertical Datum of 1929—a geodetic datum derived from a general adjustment of the first-order level nets of the United States and Canada, formerly called Sea Level Datum of 1929.

Benthic-Invertebrate and Streambed-Sediment Data for the White River and Its Tributaries in and near Indianapolis, Indiana, 1994–96

By Danny E. Renn

Abstract

Data were collected in the White River and its tributaries in and near Indianapolis, Indiana, on the diversity and density of benthic invertebrates; concentrations of metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments; and particle-size distribution of streambed sediments. A total of 369 benthic-invertebrate samples were collected at 21 sites during late spring or summer and early fall 1994 through 1996; of these, 30 were quality-control samples. A total of 33 streambed-sediment samples were collected at 14 sites during August 1994, 1995, and 1996; of these, 10 were quality-control samples.

Introduction

Approximately 40 mi² of the city of Indianapolis is serviced by a combined-sewer system (fig. 1) (Howard Needles Tammen & Bergendoff, 1983). There are 137 combined-sewer outfalls in the Indianapolis area that discharge into the White River and its tributaries; 29 combined-sewer outfalls discharge directly into the White River, 28 to Fall Creek, 6 to Eagle Creek, 49 to Pleasant Run, 4 to Bean Creek, and 21 to Pogues Run (written commun., Indianapolis Department of Public Works).

The City of Indianapolis is responsible for managing its combined-sewer system and for determining strategies to mitigate the effect of combined-sewer overflows on receiving streams in and near Indianapolis (fig. 1). To evaluate

impacts of the sewer overflows and to develop the strategies, the City needs information on stream quality.

In 1993, the Indianapolis Department of Public Works (DPW) and the U.S. Geological Survey (USGS) began a cooperative study to determine the diversity and density of benthic invertebrates; concentrations of selected metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments; and particle-size distribution of streambed sediments in the White River and its tributaries in and near Indianapolis. The study was intended to supplement an existing river-quality-monitoring network operated by the department. While water samples reflect stream quality only at the time of sampling, benthic-invertebrate populations reflect long-term and short-term water-quality conditions because of their limited mobility. The differing sensitivity of benthic invertebrates to particular contaminants allows the presence or absence of particular types of benthic invertebrates to be used as an indicator of stream quality. Additionally, benthic invertebrates are found in all aquatic habitats and are easy to collect (Lenat and others, 1980). Chemical constituents sorbed on streambed sediments are not as transient as chemical constituents in the water column. Consequently, concentrations of these metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments also can be used as indicators of long-term water-quality conditions. Because of the positive correlation between decreasing particle size and increasing chemical concentrations in sediment (Horowitz, 1991), the particle-size distribution of streambed sediments can be used to help determine the variability in chemical constituents sorbed on streambed sediments.

Purpose and Scope

This report provides information on sampling locations and data collected as part of this study for sites on the White River and its tributaries in and near Indianapolis. Data collected include (1) the diversity and density of benthic invertebrates; (2) the concentrations of metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments; and (3) the particle-size distribution of streambed sediments. From 1994 through 1996, 369 benthic invertebrate samples were collected at 21 sites, and 33 streambed sediments were collected at 14 sites.

Description of Study Area

The study focuses on the White River and selected tributaries in and near the city of Indianapolis. The drainage area of the White River above the confluence of the East Fork White River is 5,372 mi². The study area encompasses a 979-mi² drainage area that is 18.2 percent of the White River Basin above the confluence of the East Fork White River. The study used 21 sampling sites: 18 in Marion County, 1 in Hamilton County, and 2 in Morgan County. Indianapolis, the capital of Indiana, is the largest city in the State and is incorporated with Marion County. Marion County has a population of 783,042 (Bureau of the Census, 1990) and a surface area of 402 mi² (Sturm and Gilbert, 1978).

The study area is underlain by limestone; dolomite; siltstone; and shale of Silurian, Devonian, and Mississippian ages (Gray and others, 1987). The soils adjacent to the White River and its tributaries in the study area are loam soils that formed in unconsolidated glacial outwash that consists of stratified silt to boulder-size deposits and alluvium that consists of stratified sand to gravel-size deposits (Sturm and Gilbert, 1978). In most of the study area, these deposits range in thickness from 50 to 100 ft, but in the lower part of the study area these deposits can be less than 50 ft thick (Gray, 1983). The remaining soils in

the study area are silt-loam soils that formed in unconsolidated glacial till consisting of non-stratified silt to boulder-size deposits (Sturm and Gilbert, 1978). In most of the study area these glacial till deposits range in thickness from 100 to 250 ft, but in the lower part of the study area these deposits can be less than 50 ft thick (Gray, 1983). The study area is located in the Tipton Till Plain physiographic unit (Schneider, 1966), which is rolling to gently rolling in the area of glacial till deposits and generally flat in the areas covered by glacial outwash and alluvium.

The streams in the study area generally have low slopes and meandering channels that primarily contain silt to gravel-size material with areas of cobble to boulder-size material that generally form run and riffle areas. In the study area are four low-head dams on the White River and two low-head dams on Fall Creek (figure 1). These dams raise the level of the streams, decrease the streamflow velocities, and increase travel time through the pooled sections of the stream. Land use in the area of Indianapolis is primarily urban, and land use outside the Indianapolis area is primarily agricultural and forest.

The White River and its two largest tributaries, Fall Creek and Eagle Creek, are the major sources of water for public and industrial supply for Indianapolis because they generally have sufficient streamflows even during dry periods (Duwelius, 1990). Flows in Fall Creek are affected by Geist Reservoir, which has a storage capacity of 6.9 billion gallons at a reservoir elevation of 785 ft above sea level (Herring, 1974). Flows in Eagle Creek are affected by Eagle Creek Reservoir, which has a storage capacity of 7.8 billion gallons at a reservoir elevation of 790 ft above sea level (Herring, 1974). These reservoirs generally attenuate high streamflows and augment low streamflows.

The study area is located in the central climate division in Indiana and has a continental-type climate characterized by hot, humid summers and cold, wet winters (Newman, 1966). The mean precipitation in the central climate division for the

¹Hoggatt, 1975.

period 1961 through 1990 was 40.5 in. (Stewart and others, 1995). During the study period, precipitation in the central climate division was 38.8 in. in 1994 (Stewart and others, 1995); 35.5 in., 1995 (Stewart and others, 1996); and 44.5 in., 1996 (Stewart and others, 1997).

Methods of Data Collection

A total of 21 sampling sites were located on the White River and its tributaries (table 1). Ten sites were on the White River, one on Williams Creek, two on Fall Creek, two on Eagle Creek, two on Pleasant Run, two on Bean Creek, and two on Pogues Run. Benthic invertebrates were sampled at all 21 sites to determine diversity and density. Streambed-sediment samples were collected at 14 sites to determine concentrations of metals, insecticides, herbicides, and semivolatile organic compounds sorbed on the streambed sediments and to determine particle-size distributions of streambed sediments.

Hydrologic Conditions

Samples were collected during periods of low-flow or steady-state streamflow conditions. After review of the USGS streamflow-gaging records in the study area, several sites were selected to be representative of streamflow conditions at all the sampling sites. Table 2 shows monthly mean streamflows during the sampling periods for the streamgauge sites and monthly precipitation in the central climate division in Indiana. Table 2 data represent streamflow conditions at sites having drainage areas from 7.58 mi² to 1,898 mi². Drainage areas at sampling sites on the White River range from 1,147 mi² to 2,126 mi² (table 1) and on the tributaries from 4.00 mi² to 317 mi² (table 1) (Hoggatt, 1975). Although monthly mean streamflow during the study period was frequently higher than the long-term mean for the period of record, samples were collected following a period of low-flow conditions and

during steady-state streamflow conditions. During the study period, monthly precipitation generally was greater than the long-term mean-monthly precipitation during the months of April, May, and June. During July, August, and September, precipitation was generally lower than the mean-monthly precipitation.

Collection of Benthic Invertebrates

Throughout the study, samples were collected at 21 sites in the study area to determine the diversity and density of benthic invertebrates. Benthic invertebrates were collected at 19 of these sites during May and September 1994. After a review of the 1994 data and consultation with DPW, 1 site was discontinued and 2 sites were added; 20 sites were sampled during July and September 1995 and September 1996. (Data, however, are not available for the Williams Creek site for September 1995.) During July 1996, only 16 sites were sampled before a storm caused high water that prevented access to the remaining number of sites. At each site, three samples from different locations within the stream channel were collected during each sampling event. Three quality-control samples were collected at two sites during May and September 1994 and July and September 1995, and at one site during July 1996 and September 1996. A total of 369 benthic-invertebrate samples were collected during the study, including the 30 quality-control samples.

The three samples collected at each site were the minimum number needed to determine the diversity and density of benthic invertebrates at a site (Britton and Greeson, 1988). Benthic-invertebrate samples were collected twice a year during periods when most species are expected to be in early aquatic stages and prior to their adult terrestrial stage. At each site, samples were collected in habitat areas where the greatest diversity and density of benthic invertebrates were expected. The habitat areas were generally riffle

areas with gravel to cobble-size substrate material. Streams did not have identical morphology and sites varied in habitat conditions ranging from riffles to pooled areas, each with various sizes of substrate material. A description of the physical characteristics at each sampling site is contained in table 3 (at back of report).

A Surber sampler was used to collect benthic-invertebrate samples. The Surber sampler had a 0.0929-m² sample grid and a collection-net-bag mesh opening of 210 µm (U.S. Standard No. 70 sieve size); this mesh size has been recommended by the USGS for collecting benthic invertebrates (Britton and Greeson, 1988). To collect benthic-invertebrate samples, the bottom edge of the Surber sampler was pressed tightly against the bottom of the stream to isolate the sampling area. To remove the benthic invertebrates from the area enclosed by the sampler, the larger rocks were put in a bucket and the remaining streambed materials enclosed by the grid were scrubbed thoroughly so that the disturbed materials released from the streambed were collected in the Surber net. The rocks put in the bucket also were scrubbed, and the materials cleaned from the rocks were collected. The contents of the net and the bucket were combined and sieved through a mesh opening of 210 µm. The benthic invertebrates collected on the mesh screen were put in a container and fixed with a 10-percent Formalin solution. The benthic invertebrates were classified by a contract laboratory, TAI Environmental Sciences, Inc. Taxonomic nomenclature used in this report conform to the usage of Merritt and Cummins (1984) and Pennak (1989). The results of the taxonomic identification and counts are contained in tables 4 through 126 at the back of this report.

Collection of Streambed Sediments

Streambed sediments were collected at 14 sites to determine physical properties; concentrations of metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments (table 127); and particle-size

distributions of the streambed sediments. All samples were collected during August. Samples were collected at 12 sites during 1994. After a review of the data and consultation with DPW, eight sites were discontinued and two sites were added; six sites were sampled during 1995. After a review of the 1994 and 1995 data, five of the previously sampled sites were selected to be sampled during 1996. Ten quality-control samples were collected at six sites during 1994 and at two sites during 1995 and 1996. A total of 33 streambed-sediment samples were collected during the study.

No standard USGS method has been established for collection of streambed sediments in stream cross sections (Ward and Harr, 1990). For this study, each streambed-sediment sample consisted of two independently collected sub-samples. One sub-sample was collected for the analysis of metals and particle-size determinations and one sub-sample was collected for the analysis of insecticides, herbicides, and semi-volatile organic compounds. For both sub-samples, approximately equal volumes of the top 1 in. of fine-grained sediments were collected to represent the stream at that site. To avoid cross-contamination during sample collection, sub-samples were collected from downstream to upstream. The quality-control samples were collected upstream, or on opposite sides of the stream, from where the other samples were collected.

Polypropylene scoops and containers were used to collect and store the sediment analyzed for metals and particle-size distribution. The sediment was sieved through a polyethylene-sided 2-mm mesh screen. The sieved sediment was collected in a polyethylene pan and composited with a polypropylene scoop. Two representative samples of the composite were submitted for analysis, one for the analysis of metals and one for determination of particle-size distribution. Samples for the analysis of metals were chilled to 4°C and sent to the USGS National Water Quality Laboratory in Arvada, Colo., for analysis. Particle-size distributions were determined by the USGS sediment laboratory in Iowa City, Iowa.

Table 127. Physical properties measured during sampling; metals, insecticides, herbicides, and semivolatile organic compounds analyzed from streambed-sediment samples from the White River and its tributaries in and near Indianapolis, Indiana

2,4,6-Trichlorophenol			2,4-Dichlorophenol
2,4-Dinitrophenol			2,4-Dinitrotoluene
2,4-Dimethylphenol [2,4-DP]			2,6-Dinitrotoluene
2-Chloronaphthalene			2-Chlorophenol
2-Methyl-4,6-dinitrophenol [4,6-DINITROORTHOCRESOL]			2-Nitrophenol
4-Bromophenyl-phenylether			4-Chlorophenyl-phenylether
4-Chloro-3-methylphenol [PARACHLOROMETACRESOL]			4-Nitrophenol
Acenaphthene			Acenaphthylene
Anthracene			Benzo(a)pyrene
Benzo(b)fluoranthene			Benzo(k)fluoranthene
Benzo(a)anthracene [BENZO A ANTHRACENE 1,2-BENZANTHRACENE]			
Benzo(g,h,i)perylene [BENZOGHI PERYLENE 1,12-BENZOPERYLENE]			
Bis(2-chloroethoxy)methane			Bis(2-chloroethyl)ether
Bis(2-chloroisopropyl)ether			Bis(2-ethylhexyl)phthalate
Butylbenzylphthalate [N-BUTYLBENZYLPHTHALATE]			Carbon, inorganic
Carbon, inorganic + organic [CARBON, INORG + ORGANIC]			Chrysene
Dibenz(a,h)anthracene [1,2,5,6-DIBENZANTHRACENE]			Di-n-butylphthalate
Di-n-octylphthalate			Diethylphthalate
Dimethylphthalate			Fluoranthene
Fluorene			Hexachlorobenzene
Hexachlorobutadiene [HEXACHLOROBUTADIENCE]			Hexachlorocyclopentadiene
Hexachloroethane			Indeno(1,2,3-cd)pyrene
Isophorone			N-Nitrosodi-n-propylamine
N-Nitrosodimethylamine			N-Nitrosodiphenylamine
Naphthalene			Nitrobenzene
Pentachlorophenol			Phenanthrene
Phenol [PHENOL(C ₆ H ₅ OH)]			Pyrene

All equipment used for collection of the metals sub-sample was cleaned and decontaminated before each sample was collected. After each sample collection, all equipment was scrubbed thoroughly and rinsed with native-stream water, tap water, and deionized water. All equipment then was rinsed thoroughly with a 5-percent nitric-acid solution followed by a rinse with deionized water. Before samples were collected, all equipment was rinsed three times with native-stream water. For the first sample collection, except for the use of native-stream water, all equipment was cleaned and decontaminated with the same procedures at the USGS Indiana District laboratory.

Glass beakers were used to collect and store the sediment analyzed for insecticides, herbicides, and semivolatile organic compounds. The sediment was sieved through a 2-mm stainless-steel mesh screen. The sieved sediment was collected in a glass pan and composited with a glass beaker. Three representative samples of the composite were submitted for analysis: one for insecticides, one for herbicides, and one for semivolatile organic compounds. All samples were chilled to 4°C and sent to the USGS National Water Quality Laboratory for analysis.

All equipment used for collection of the insecticides, herbicides, and semivolatile organic compounds sub-sample was cleaned and decontaminated before samples were collected. After each sample collection, all equipment was scrubbed thoroughly and rinsed with native-stream water, tap water, and deionized water. All equipment then was rinsed thoroughly with methanol.

Before samples were collected, all equipment was rinsed three times with native-stream water. For the first sample collection, except for the use of native-stream water, all equipment was cleaned and decontaminated with the same procedures at the USGS Indiana District laboratory. Table 128 (at back of report) lists data for physical properties; concentrations of metals, insecticides, herbicides, and semivolatile organic compounds; and particle-size distribution of streambed sediments determined at each site.

Summary

Data were collected in the White River and its tributaries in and near Indianapolis, Ind., during a cooperative study between the Indianapolis DPW and the USGS from 1994 through 1996. These data were collected to provide information on the diversity and density of benthic invertebrates; concentrations of metals, insecticides, herbicides, and semivolatile organic compounds sorbed on streambed sediments; and particle-size distributions of streambed sediments. This information may be used to help determine control strategies for mitigating the effects of combined-sewer overflows on receiving streams.

A total of 369 benthic-invertebrate samples were collected at 21 sites during late spring or summer and early fall 1994 through 1996; of these, 30 were quality-control samples. A total of 33 streambed-sediment samples were collected at 14 sites during August 1994, 1995, and 1996; of these, 10 were quality-control samples.

Data Tables

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996

[USGS, U.S. Geological Survey; IN, Indiana; mi², square miles; riffle—turbulent flow, shallow, coarse-grain substrate; run—laminar flow, less turbulent flow, variable depth and substrate; pool—very low current velocity, relatively deep, depositional area, accumulations of fine sediment particles; bar—a depositional feature that is located in the active part of the stream channel and is generally composed of gravel to cobble-size deposits that are generally flat to generally sloping and have no or little vegetation cover; fines—less than .00291 inch (0.074 millimeter); sand—.00291 inch to 0.187 inch (0.074 to 4.76 millimeters); gravel—0.187 inch to 3 inches (4.76 to 76.2 millimeters); cobble—3 inches to 10 inches (76.2 to 254 millimeters); boulder—greater than 10 inches (254 millimeters); side of stream determined by looking downstream]

Field identifier:	WR146-0
Site name:	White River at 146th Street near Noblesville, IN
USGS site-identification number:	400001086012301
Drainage area, mi²:	¹ 1,147
Sampling location:	Adjacent to bar on right side of stream, 500 feet upstream from 146th Street bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Agricultural
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Gravel and cobble, with some sand and fines
Substrate size sampled (estimated)²:	Gravel and cobble
Ancillary information:	Most upstream site in study area. Site is 4.56 miles downstream from Noblesville

Field identifier:	WRNORA-1
Site name:	White River near Nora, IN (82nd Street)
USGS site-identification number:	03351000
Drainage area, mi²:	¹ 1,219
Sampling location:	Spring 1994—on right bank, 200 feet upstream from 82nd Street bridge; all other samplings—at riffle area, 1,000 feet upstream from 82nd Street bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Urban
Flow characteristics:	Spring 1994—run; all other samplings—riffle
Substrate size in stream reach (estimated)²:	Spring 1994—fines, sand, gravel, and cobble; other samplings—cobble, gravel, boulder, and sand
Substrate size sampled (estimated)²:	Spring 1994—cobble (primarily riprap), gravel, and sand; other samplings—cobble and gravel

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	WRINDY-2
Site name:	White River at Indianapolis, IN (Morris Street)
USGS site-identification number:	03353000
Drainage area, mi²:	¹ 1,635
Sampling location:	On left side of stream; spring 1994—50 feet upstream from Morris Street bridge adjacent to bar; fall 1994—under the bridge; spring 1995—one site 50 feet upstream from bridge adjacent to bar, one site under the bridge, and one site 50 feet downstream from bridge adjacent to bar; all other samplings—under the bridge
Stream-channel type:	Natural, with levees close to stream
Bank vegetation:	Trees and brush
Land use in general vicinity of stream:	Urban
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Fines, gravel, cobble, and sand
Substrate size sampled (estimated)²:	Gravel and cobble, with some fines and sand
Ancillary information:	Site is located in the center of Indianapolis. Sampling location under the bridge had faster streamflow velocities and greater amount of gravel and cobble than other sampling sites. Sampling location under the bridge generally not in sunlight. Fines were generally black organic material, and some of the gravel and cobble-size material was manmade material (broken concrete, bricks)
Field identifier:	WRHARD-3
Site name:	White River at Harding Street, Indianapolis, IN
USGS site-identification number:	03353193
Drainage area, mi²:	¹ 1,660
Sampling location:	Spring 1994—two sites on the left side of the stream, 200 feet downstream from Harding Street bridge and one site on right side of stream, 25 feet downstream from large combined-sewer outfalls; fall 1994—on right side of stream, 25 feet downstream from large combined-sewer outfalls; all other samplings—on right side of stream downstream from the bridge and upstream from large combined-sewer outfalls
Stream-channel type:	Natural, with levees close to stream
Bank vegetation:	Trees upstream and grass/weeds downstream from Harding Street bridge
Land use in general vicinity of stream:	Urban
Flow characteristics:	Pool
Substrate size in stream reach (estimated)²:	Fines, cobble, and gravel
Substrate size sampled (estimated)²:	Cobble and gravel, with some fines
Ancillary information:	There are large combined-sewer outfalls 75 feet downstream from the bridge. The site is located 1.15 miles upstream from the outfall for the Belmont advanced wastewater-treatment plant and 1.75 miles upstream from the dam at the Stout Generating Station, which creates the pooled condition. The fines were generally black organic material, and the cobble and gravel-size material was primarily crushed stone

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	WRSTUP-19
Site name:	White River at Stout Generating Station at Indianapolis, IN
USGS site-identification number:	03353611
Drainage area, mi²:	¹ 1,898
Sampling location:	Left side of stream immediately upstream from the Stout Generating Station
Stream-channel type:	Natural, with levees away from stream
Bank vegetation:	Grass and weeds
Land use in general vicinity of stream:	Industrial
Flow characteristics:	Pool
Substrate size in stream reach (estimated)²:	Fines and gravel
Substrate size sampled (estimated)²:	Gravel and some fines
Ancillary information:	The site is located 3,000 feet downstream from the outfall for the Belmont advanced wastewater-treatment plant and 2,000 feet upstream from the dam at the Stout Generating Station, which creates the pooled condition. The fines were generally black organic material and the gravel-size material was primarily crushed stone
Field identifier:	WRSTDN-20
Site name:	White River below Stout Generating Station at Indianapolis, IN
USGS site-identification number:	394234086120900
Drainage area, mi²:	³ 1,899
Sampling location:	At riffle areas adjacent to islands, 100 feet downstream from the dam at the Stout Generating Station
Stream-channel type:	Natural, with levees away from stream
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Cobble, boulder, and gravel
Substrate size sampled (estimated)²:	Cobble, with some gravel
Ancillary information:	Site had the greatest streamflow velocities of all sites

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	WRTBLF-4
Site name:	White River at Tibbs-Banta Landfill near Southport, IN
USGS site-identification number:	394019086134601
Drainage area, mi²:	¹ 1,920
Sampling location:	Adjacent to bar on left side of stream at west end of Tibbs-Banta Landfill
Stream-channel type:	Natural, with levees away from stream
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Cobble and gravel, with some sand
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	Tibbs-Banta Landfill is an inactive landfill. The landfill ceased operation in 1974 and received municipal wastewater sludge during 1983 through 1984, which was part of a revegetation project. The site is located 0.85 miles upstream from the outfall for the Southport advanced wastewater-treatment facility
Field identifier:	WRWICK-5
Site name:	White River at Wicker Road near Southport, IN
USGS site-identification number:	393827086141701
Drainage area, mi²:	¹ 1,947
Sampling location:	Adjacent to bar on left side of stream, 500 feet west of terminus of Wicker Road
Stream-channel type:	Natural, with levees away from stream
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Gravel, cobble, and sand
Substrate size sampled (estimated)²:	Gravel and cobble
Ancillary information:	The site is located 2.5 miles downstream from the outfall for the Southport advanced wastewater-treatment facility and 1 mile downstream from Mann Hill
Field identifier:	WRWAVE-6
Site name:	White River near Waverly, IN (State Road 144)
USGS site-identification number:	393402086152000
Drainage area, mi²:	¹ 2,026
Sampling location:	Spring 1994—adjacent to bar on right side of stream, 100 feet downstream from State Road 144 bridge; all other samplings—at riffle area 50 feet upstream from bridge
Stream-channel type:	Natural
Bank vegetation:	Right side of stream—weeds; left side of stream—trees
Land use in general vicinity of stream:	Right side of stream—agricultural; left side of stream—woodland
Flow characteristics:	Spring 1994—run; all other samplings—riffle
Substrate size in stream reach (estimated)²:	Adjacent to bar—cobble, gravel, and sand; in riffle areas—cobble, gravel, and boulder
Substrate size sampled (estimated)²:	Cobble and gravel

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	WRHEND-18
Site name:	White River at Henderson Bridge near Adams, IN
USGS site-identification number:	392956086212001
Drainage area, mi²:	¹ 2,126
Sampling location:	Adjacent to bar on right side of stream, 500 feet upstream from Road 390 East bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Agricultural
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Gravel and cobble, with some sand
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	Most downstream site in study area
Field identifier:	WC96-12
Site name:	Williams Creek at 96th Street, Indianapolis, IN
USGS site-identification number:	03351072
Drainage area, mi²:	³ 17.0
Sampling location:	At riffle areas, 100 feet upstream from 96th Street bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Cobble, boulder, gravel, and sand
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	1,000 feet downstream from north leg of Interstate 465
Field identifier:	FC71-16
Site name:	Fall Creek at 71st Street near Lawrence, IN
USGS site-identification number:	395259086001601
Drainage area, mi²:	¹ 243
Sampling location:	Spring 1994—on right side of stream, 150 feet downstream from 71st Street bridge; fall 1994—on left side of stream, 20 to 200 feet downstream from the bridge; spring and fall 1995—upstream from pier of the bridge; spring 1996—one site upstream from pier and two sites downstream from pier of the bridge; fall 1996—on right side of stream under the bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland
Flow characteristics:	Spring 1994—riffle; all other samplings—run
Substrate size in stream reach (estimated)²:	Downstream from the bridge—gravel, sand, and cobble; upstream from and under the bridge—cobble, gravel, sand, and boulder
Substrate size sampled (estimated)²:	Downstream from the bridge—gravel and cobble; upstream from and under the bridge—cobble and gravel
Ancillary information:	Site is 2.1 miles downstream from Geist Reservoir. Prior to fall 1996 sampling, the channel downstream from the bridge had been straightened

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	FC16-10
Site name:	Fall Creek at 16th Street at Indianapolis, IN
USGS site-identification number:	03352875
Drainage area, mi²:	¹ 317
Sampling location:	Spring 1994—adjacent to right side of island, 200 feet downstream from 16th Street bridge; all other samplings—at riffle area upstream from island
Stream-channel type:	Channeled and recovered, with levees close to stream
Bank vegetation:	Trees
Land use in general vicinity of stream:	Urban
Flow characteristics:	Spring 1994—run; all other samplings—riffle
Substrate size in stream reach (estimated)²:	Spring 1994—sand, fines, gravel, and cobble; all other samplings—cobble, gravel, sand, and boulder
Substrate size sampled (estimated)²:	Spring 1994—gravel and cobble; all other samplings—cobble and gravel
Ancillary information:	The site is 2,000 feet downstream from outfalls for a water-treatment facility that discharges filter backwash effluent
Field identifier:	ECDAN-17

USGS site-identification number:	394851086181301
Drainage area, mi²:	³ 164
Sampling location:	At riffle area, 50 feet upstream from Dandy Trail Road bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Woodland and field
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Boulder, cobble, gravel, and sand
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	Site is 0.9 mile downstream from Eagle Creek Reservoir
Field identifier:	ECRAY-11
Site name:	Eagle Creek at Raymond Street at Indianapolis, IN
USGS site-identification number:	394613086114700
Drainage area, mi²:	¹ 209
Sampling location:	Close to left bank, 50 feet downstream from the Kentucky Avenue bridge
Stream-channel type:	Channeled and recovered, with levees close to stream
Bank vegetation:	Left bank—trees; right bank—grass/weeds
Land use in general vicinity of stream:	Urban
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Sand, cobble, gravel, and boulder
Substrate size sampled (estimated)²:	Cobble and gravel

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	PLR16-13
Site name:	Pleasant Run at East 16th Street at Indianapolis, IN
USGS site-identification number:	394721086031001
Drainage area, mi²:	³ 4.00
Sampling location:	At riffle areas, 200 feet upstream from East 16th Street bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Urban
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Cobble, gravel, sand, and boulder
Substrate size sampled (estimated)²:	Cobble and gravel
Field identifier:	PLRMER-7
Site name:	Pleasant Run near South Meridian Street at Indianapolis, IN
USGS site-identification number:	394358086092100
Drainage area, mi²:	¹ 20.8
Sampling location:	Spring and fall 1994 and spring 1995—riffle area, 20 feet downstream from the foot bridge between South Meridian Street and Madison Avenue; fall 1995 and spring and fall 1996—riffle area, 100 feet upstream from the foot bridge
Stream-channel type:	Channeled and recovered, with levees close to stream
Bank vegetation:	Grass/weeds, with some brush and trees
Land use in general vicinity of stream:	Urban
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Gravel and sand, with some cobble
Substrate size sampled (estimated)²:	Gravel and cobble
Ancillary information:	Prior to the fall 1995 sampling, a major streamflow event changed the channel geometry
Field identifier:	BCSOU-15
Site name:	Bean Creek at Southern Avenue at Indianapolis, IN
USGS site-identification number:	394349086080001
Drainage area, mi²:	³ 5.00
Sampling location:	Riffle area, 100 feet upstream from the end of Southern Avenue
Stream-channel type:	Natural
Bank vegetation:	Brush, trees, and grass/weeds
Land use in general vicinity of stream:	Urban
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Gravel, cobble, sand, and fines
Substrate size sampled (estimated)²:	Gravel and cobble

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	BCGARF-9
Site name:	Bean Creek at Garfield Park at Indianapolis, IN
USGS site-identification number:	394358086083901
Drainage area, mi²:	³ 5.30
Sampling location:	20 feet upstream to 150 feet downstream from the foot bridge between the ampitheater and conservatory at Garfield Park
Stream-channel type:	Channeled and recovered
Bank vegetation:	For 1994 samplings—trees and brush; other samplings—brush, grass/weeds, and trees
Land use in general vicinity of stream:	Field, woodland, and urban
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Cobble, gravel, sand, and fines
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	Vegetation along banks was thinned after 1994 samplings

Field identifier:	POR21-14
Site name:	Pogues Run at East 21st Street at Indianapolis, IN
USGS site-identification number:	394746086055601
Drainage area, mi²:	³ 4.40
Sampling location:	50 feet upstream from the East 21st Street bridge
Stream-channel type:	Natural
Bank vegetation:	Trees
Land use in general vicinity of stream:	Urban
Flow characteristics:	Riffle
Substrate size in stream reach (estimated)²:	Gravel, cobble, fines, sand, and boulder
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	Gravel, cobble, and boulder-size material was generally manmade material (broken concrete, bricks)

Table 3. Habitat characteristics for sites on the White River and its tributaries in and near Indianapolis, Indiana, where benthic invertebrates were collected, 1994 through 1996—Continued

Field identifier:	PORVER-8
Site name:	Pogues Run at Vermont Street, Indianapolis, IN
USGS site-identification number:	03352990
Drainage area, mi²:	¹ 8.87
Sampling location:	50 feet downstream from Vermont Street
Stream-channel type:	Channeled (left bank—concrete lined; right bank—faced with riprap)
Bank vegetation:	Left bank—no vegetation; right bank—trees
Land use in general vicinity of stream:	Industrial
Flow characteristics:	Run
Substrate size in stream reach (estimated)²:	Fines, sand, gravel, cobble, boulder
Substrate size sampled (estimated)²:	Cobble and gravel
Ancillary information:	At Vermont Street, Pogues Run goes under Indianapolis and outfalls into the White River. Fines were generally black organic material and the gravel, cobble, and boulder-size material was generally manmade material (broken concrete, bricks)

¹From Hoggatt (1975).

²Listed in order of predominance.

³Estimated value from Hoggatt (1975).

Abbreviations Used in Tables 4 through 126

$\mu\text{S}/\text{cm}$	Specific conductance of water is expressed in micro-siemens per centimeter at 25 degrees Celsius ($\mu\text{S}/\text{cm}$). This unit is equivalent to micromhos per centimeter at 25 degrees Celsius ($\mu\text{mho}/\text{cm}$), formerly used by the U.S. Geological Survey.
$^{\circ}\text{C}$	degrees Celsius
mi^2	square miles
m^2	square meter
mg/L	Chemical concentration is given in milligrams per liter.

NOTE: Blanks in tables indicate no organisms found.

Table 100. Benthic-invertebrate data for station 394721086031001 Pleasant Run at East 16th Street at Indianapolis, IN

[sp., species]

Field identifier: PLR16-13

Habitat: cobble and gravel; riffle

Specific conductance: 607 $\mu\text{S}/\text{cm}$ at 25°C

Date: July 17, 1996

Drainage area: 4.00 mi^2

Dissolved oxygen: 8.1 mg/L

Time: 1445

Water temperature: 24.2°C

pH: 7.78 units
