INTRODUCTION

This report contains analytical data for 144 rock samples, 358 stream-sediment samples, 3 mill tailings samples, and 25 soil samples collected by the U. S. Geological Survey (USGS), and 27 soil, and 11 stream-sediment samples collected during the National Uranium Resource Evaluation (NURE) program. Included in the 358 stream-sediment samples collected by the USGS are 202 samples collected as part of the current study and 156 samples collected as part of Bureau of Land Management (BLM) Wilderness Study Area (WSA) investigations of three areas: the Coxcomb Mountains, the Eagle Mountains, and the Sheep Hole Mountains WSAs. The NURE and BLM WSA samples were re-analyzed for the present study. All samples are from Joshua Tree National Park and vicinity, Riverside and San Bernardino Counties, California. The analyses of these samples can be used for baseline geochemical, mineral resource, and environmental geochemical studies.

The location of Joshua Tree National Park is shown in figure 1. The park occupies 794,300 acres (1,241 sq. mi.) at the eastern end of the Transverse Ranges geomorphic province of southern California. Mountain ranges in, and adjacent to, the park include the Cottonwood, Coxcomb, Eagle, Hexie, Little San Bernardino, Pinto, and Sheep Hole Mountains. The park includes parts of two deserts, the lower-elevation Colorado Desert, in the eastern half of the park, and the higher-elevation Mojave Desert, in the western half. Geology of the park has recently been described by Trent (1998). Predominant rock types include various Mesozoic granitic rock units, Cenozoic basaltic flow units, and Proterozoic metasedimentary, metaigneous, and metamorphic rock units.

This report consists of two parts. Part A is this printed report. Part B is an IBM-compatible digital version of most of Part A on an 1.44 MB diskette. The diskette includes this text in ASCII, and Corel WordPerfect, version 6.1 format, as well as an ASCII "readme" file, and the complete data for tables 3 through 6 in both "dbf" and "wk1" formats. The "dbf" files are similar to the tables in part A. The "wk1" files are more complete and include the specific limits for elements with more than one lower limit of determination. The wk1 file for table 3 also includes the rock descriptions. The four figures are not included in the diskette version.

SAMPLE COLLECTION AND PREPARATION

A total of 144 rock samples were collected from 135 sites. The samples consisted of composited chips from several outcrops, or of a composite of several grab samples from a mine or prospect dump, that were collected from within a 30-meter radius of each sample site plotted on figure 2. Three samples of mill tailings were collected from three mill sites, and are included in the rock data set.

Samples of bulk stream sediment were collected from 202 sites. All samples were taken from dry stream beds, and most were from stream beds with gentle to moderate gradients. The bulk stream sediment at each site was composited from several localities extending across what appeared to be the most recently active stream channel and within an area of 30-meter radius of each site plotted on figure 3.

Soil samples were collected from 25 sites. Eighteen of these samples are from a soil traverse that crossed Smoke Tree Wash, just east of the Hexie Mountains. These samples were taken at a spacing of roughly 200 ft (61 m). This traverse was done to provide on-the ground

Figure 1. Maps showing location of Joshua Tree National Park, California

information to aid in interpretation of remote sensing information. The other seven soil samples were collected for other investigations. All of the soil samples were composited from material collected from about six locations within an area with about a 10-meter radius of each soil-sample site plotted on figure 3.

Selected stream-sediment samples previously collected for USGS reconnaissance geochemical studies of three BLM WSAs, and stream-sediment and soil samples previously collected for the NURE program study of the Salton Sea 1 x 2 degree quadrangle were obtained from USGS archives in Denver, CO, for re-analysis. The BLM WSAs and the reports of original geochemical data are the Coxcomb Mountains WSA (Kilburn, and others, 1983), the Eagle Mountains WSA (Day, and others, 1985), and the Sheep Hole Mountains WSA. The latter WSA was abandoned by the BLM and an analytical data report was not released. NURE sampling (Heffner, 1980) was done in 1979 in areas outside of the then Joshua Tree National Monument that have since become part of Joshua Tree National Park. NURE sampling was not conducted within the monument. NURE sampling methods are described in Price and Jones (1979). Locations of the WSA and NURE sample sites are shown on figure 4.

The rock, stream-sediment, and seven of the soil samples collected during the present study were prepared and analyzed by Activation Laboratories, Inc. (ACTLABS). ACTLABS (now ENZYME Laboratories, Inc.) routinely crushed the entire rock sample to minus-10-mesh (2 mm), mechanically split the rock sample, and pulverized one of the splits to at least minus-150-mesh for analysis. The stream-sediment and soil samples were sieved at the sample site to minus-2-mm with stainless-steel sieves. These samples were further sieved in the laboratory and the minus-80-mesh (0.18-mm) fraction was retained for analysis and pulverized as described for the rock samples.

The stream-sediment samples from the BLM WSAs, and the NURE stream-sediment and soil samples had previously been prepared. The WSA samples were sieved to minus-80-mesh and the NURE samples, to minus-100-mesh. The samples had been pulverized to a fine powder that was also approximately minus 150-mesh.

The stream-sediment samples from the Coxcomb Mountains, and Sheep Hole Mountains WSAs, the NURE samples, and the 18 soil samples from the traverse across Smoke Tree Wash were analyzed by XRAL Laboratories. The samples from the Eagle Mountains WSA were analyzed by ACTLABS.

ANALYTICAL METHODS

All samples were submitted to the laboratories in a random sequence and generally in groups of 40 samples. Duplicate samples and internal standards were submitted with the samples to check the accuracy and reproducibility of the analyses. ACTLABS analyzed samples for 29 elements (As, Au, Ba, Br, Ce, Co, Cr, Cs, Eu, Fe, Hf, Hg, Ir, La, Lu, Na, Nd, Rb, Sb, Sc, Se, Sm, Sn, Ta, Tb, Th, U, W, and Yb) by instrumental neutron activation (INAA), and for 19 elements (Ag, Al, Be, Bi, Ca, Cd, Cu, K, Mg, Mn, Mo, Ni, P, Pb, Sr, Ti, V, Y, and Zn) by inductively coupled plasma-atomic emission spectrometry (ICP-AES) after a hot-acid extraction technique. The elements analyzed and lower limits of determination are listed in table 1.

XRAL analyzed samples using two methods of ICP-AES, a partial-extraction method, and a hot-acid extraction method. The methods are similar to those described by Motooka (1990), and by Briggs (1990), respectively. Nine elements (Ag, As, Bi, Cd, Cu, Mo, Pb, Sb, and

Table 1. Lower limits of determination for ACTLABS instrumental neutron activation analysis (INAA), and inductively coupled plasma-atomic emission spectrometric analysis (ICP-AES)

Instrumental neutron activation analysis (INAA)			
Element	Lower limit	Element	Lower limit
Antimony (Sb)	0.1 ppm*	Mercury (Hg)	1 ppm
Arsenic (As)	0.5 ppm	Neodymium (Nd)	5 ppm
Barium (Ba)	50 ppm	Rubidium (Rb)	15 ppm
Bromine (Br)	0.5 ppm*	Samarium (Sm)	0.1 ppm
Cerium (Ce)	3 ppm	Scandium (Sc)	0.1 ppm
Cesium (Cs)	1 ppm	Selenium (Se)	3 ppm*
Chromium (Cr)	5 ppm	Sodium (Na)	0.01 %
Cobalt (Co)	1 ppm	Tantalum (Ta)	0.5 ppm*
Europium (Eu)	0.2 ppm	Terbium (Tb)	0.5 ppm
Gold (Au)	2 ppb*	Thorium (Th)	0.2 ppm
Hafnium (Hf)	1 ppm	Tin (Sn)	100 ppm*
Iridium (Ir)	5 ppb	Tungsten (W)	1 ppm*
Iron (Fe)	0.01 %	Uranium (U)	0.5 ppm
Lanthanum (La)	0.5 ppm	Ytterbium (Yb)	0.2 ppm
Lutetium (Lu)	0.05 ppm		

Inductively coupled plasma-atomic emission spectrometric analysis (ICP-AES)

Element	Lower limit	Element	Lower limit
Aluminum (Al)	0.01 %	Nickel (Ni)	1 ppm
Beryllium (Be)	2 ppm	Phosphorus (P)	0.001 %
Bismuth (Bi)	5 ppm	Potassium (K)	0.01 %
Cadmium (Cd)	0.5 ppm	Silver (Ag)	0.5 ppm*
Calcium (Ca)	0.01 %	Strontium (Sr)	1 ppm
Copper (Cu)	1 ppm	Titanium (Ti)	0.01 %
Lead (Pb)	5 ppm	Vanadium (V)	2 ppm
Magnesium (Mg)	0.01 %	Yttrium (Y)	2 ppm
Manganese (Mn)	1 ppm	Zinc (Zn)	1 ppm
Molybdenum (Mo)	2 ppm		

* Some additional lower limits were used for these elements, as given in the tables of part B of this report.

Zn) were analyzed by the partial-extraction method of ICP-AES, and 37 elements (Ag, Al, Au, Ba, Be, Ca, Cd, Ce, Co, Cr, Cu, Eu, Fe, Ga, Ho, K, La, Li, Mg, Mn, Mo, Na, Nb, Nd, Ni, P, Pb, Sc, Sr, Ta, Th, Ti, U, V, Y, Yb, and Zn) were analyzed by the hot-acid extraction method. The elements analyzed and lower limits of determination are given in table 2. In addition to the methods noted above and the elements listed in table 2, the soil samples from the Smoke Tree Wash traverse (table 6) were also analyzed by XRAL for Hg by cold vapor-atomic absorption spectrophotometry (CV-AA) by a method similar to that described by O'Leary and others (1990).

The results for all elements analyzed by the two laboratories are listed in tables 3-6 of Part A and are included as digital files in Part B of this report. Elements with no reported values have been omitted from tables 3-6 in part A of the report. As a result, of the original 48 elements determined by ACTLABS, one determined by INAA (Ir), was deleted from the rock data set (table 3), and two elements determined by INAA (Ir and Hg) were deleted from the stream-sediment data set (table 4). Tin (Sn) by INAA, with a single value (200 ppm in sample EM018), was also omitted from the stream sediment data set. Of the original 46 elements determined by XRAL, one determined by the partial extraction method of ICP-AES (Ag), and four determined by the hot-acid extraction method of ICP-AES (Cd, Ho, Mo, and U), were deleted from the stream-sediment and soil data set presented in table 5. Two elements determined by the partial-extraction method of ICP-AES (Ag and Sb), and six determined by the hot acid extraction method of ICP-AES (Ag, Au, Cd, Ho, Mo, and U) in soil samples from the traverse that crosses Smoke Tree Wash were omitted from table 6. Analyses for the remaining elements for each sample type are listed in tables 3-6.

DESCRIPTION OF DATA TABLES FOR PART A

The analyses are listed in tables 3-6. Information on the column headings and sample numbers are given below.

Sample--For each sample in tables 3-6, the first two letters identify the original project for which the samples were collected: JT and CD samples were collected for the current project; EM, for the Eagle Mountains WSA; CX, for the Coxcomb Mountains WSA; SH, for the Sheep Hole Mountains WSA, and the rest for NURE samples. For the NURE samples, the first two letters ("SS", representing Salton Sea quadrangle) have been omitted from the sample numbers included in table 5. For the NURE sample ID's used in this report, the first two letters identify the 15' quadrangle from which the samples were collected (Heffner, 1980, p. 13). The three digits following letters give the site number. For most samples, the letters following the site numbers, if present, indicate the sample type as follows: "RK" for rock, "SS" or "SD" for stream sediment, and "SL" for soil.

In table 3, a sample ID with "RK" followed by an "A", "B", or "C" and with the sample number duplicated, indicates additional samples at the same site.

Samples from WSAs generally do not have letters identifying the sample type. The Eagle Mountains WSA samples included in table 4 lack the letter suffix; however, all samples are stream sediments. In table 5, some site numbers are followed by an "S", while most site numbers are not followed by any letters; however, all of the samples in that table are stream sediments.

Latitude and longitude--The next two columns give the latitude and longitude, in degrees, minutes, and seconds, for each sample.

Table 2. Lower limits of determination for inductively coupled plasma-atomic emission spectrometry (ICP-AES), methods used by XRAL

ICP-AES, partial-extraction method			
Element	Lower limit	Element	Lower limit
Antimony (Sb)	1 ppm	Lead (Pb)	1 ppm
Arsenic (As)	1 ppm	Molybdenum (Mo)	0.1 ppm
Bismuth (Bi)	1 ppm	Silver (Ag)	0.08 ppm
Cadmium (Cd)	0.05 ppm	Zinc (Zn)	0.05 ppm
Copper (Cu)	0.05 ppm		
ICP-AES, hot acid extraction method			
Element	Lower limit	Element	Lower limit
Aluminum (Al)	0.005 %	Molybdenum (Mo)	2 ppm
Barium (Ba)	1 ppm	Neodymium (Nd)	9 ppm
Beryllium (Be)	1 ppm	Nickel (Ni)	3 ppm
Cadmium (Cd)	2 ppm	Niobium (Nb)	4 ppm
Calcium (Ca)	0.005 %	Phosphorus (P)	0.005 %
Cerium (Ce)	5 ppm	Potassium (K)	0.01 %
Chromium (Cr)	2 ppm	Scandium (Sc)	2 ppm
Cobalt (Co)	2 ppm	Silver (Ag)	2 ppm
Copper (Cu)	2 ppm	Sodium (Na)	0.005 %
Europium (Eu)	2 ppm	Strontium (Sr)	2 ppm
Gallium (Ga)	4 ppm	Tantalum (Ta)	40 ppm
Gold (Au)	8 ppm	Thorium (Th)	6 ppm
Holmium (Ho)	4 ppm	Titanium (Ti)	0.005 %
Iron (Fe)	0.02 %	Uranium (U)	100 ppm
Lanthanum (La)	2 ppm	Vanadium (V)	2 ppm
Lead (Pb)	4 ppm	Ytterbium (Yb)	1 ppm
Lithium (Li)	2 ppm	Yttrium (Y)	2 ppm
Magnesium (Mg)	0.005 %	Zinc (Zn)	2 ppm
Manganese (Mn)	4 ppm		

AG PPM, or AL PCT, through ZN PPM--These columns of analyses list the element symbol, whether the concentrations are in parts per million (PPM), parts per billion (PPB), or percent (PCT), and the analytical method. An "INAA" below the element symbol indicates instrumental neutron activation analysis; an "ICP" below the element symbol indicates inductively coupled plasma-atomic emission spectrometry (ICP-AES), with total digestion (tables 3 and 4, ACTLABS analyses); an "ICP-P" indicates a partial-extraction method of ICP-AES was used; an "ICP-T" indicates a hot-acid extraction method of ICP-AES was used; and CV-AA indicates cold vapor atomic absorption spectrophotometry.

Rock descriptions--The rock descriptions given in table 3 are field terms based on identification with a hand lens. The list also includes locality comments, where appropriate.

OTHER INFORMATION

More than one lower limit of determination was reported for some of the elements analyzed by ACTLABS. The elements with more than one lower limit are Ag, by ICP-AES, and As, Au, Br, Sb, Se, Sn, Ta, and W, by INAA. The "wk1" files in part B of this report show the correct lower limits for each censored value. Although the lower limit of determination is not shown for each qualified analysis in the tables of analyses in this part of the report, most lower limits for these elements are as shown in tables 1 and 2. These differences in lower limits possibly resulted from the use of a smaller than standard sample aliquot for a given analysis because of insufficient available sample material, or from matrix differences.

Because of the formatting in the computer programs used to produce the data in the "dbf" and "wk1" files on the diskette, the elements listed in the tables may carry one or more nonsignificant zeros to the right of the significant digits. The analysts did not determine these elements to the accuracy suggested by the extra zeros shown. In general, the elements shown in percentage, are correct to two decimal places (P is correct to three places). For other elements, values to the left of the decimal point generally do not contain more than two or three significant digits.

Sample numbers have been modified for the sample location maps (figures 2-4). All letter suffixes have been removed. For samples of the Eagle Mountains WSA (figure 4), the second letter ("M") of the prefix has also been removed.

ACKNOWLEDGEMENTS

Help provided by Joshua Tree National Park personnel, Oasis Visitor Center, Twentynine Palms, California, is appreciated. We thank Chris Murphy, USGS, for assistance in locating archived WSA samples.
