

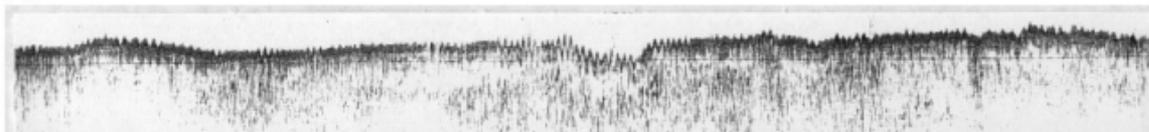

Figure 4 - 3.5-kHz subbottom profiles

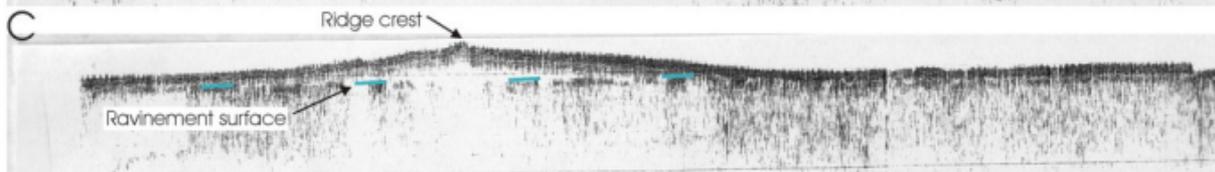

A

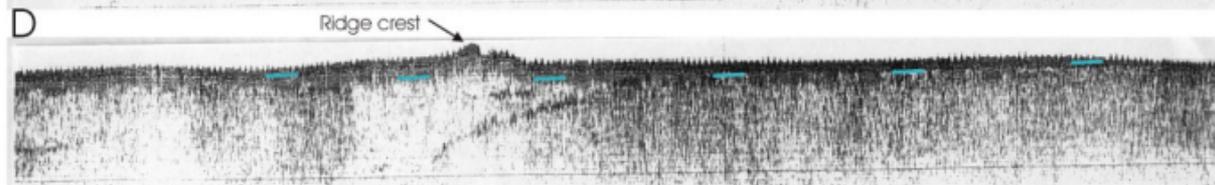

B

C

D

2 m

1 km

- (A) profile shoreward of a sand ridge showing an irregular seafloor with no Holocene sediment cover
(B) near end of a sand ridge where it has low relief (note transparent ridge deposits, ravinement surface, and reflectors in older subsurface units)
(C) crossing of a sand ridge where it has greater relief than on profile B (note asymmetry of sand ridge, the flat ravinement surface, and acoustically transparent nature of the ridge deposits)
(D) the seaward end of a sand ridge where it has relief
Profile locations show in Figure 3.
