# ALABAMA DISTRICT FLOOD PLAN

By T.S. Hedgecock, J.L. Pearman, and V.E. Stricklin

## INTRODUCTION

The purpose of this flood plan is to outline and record advance planning for flood emergencies, so that all personnel will know the general plan and have a ready-reference for necessary information. This will ensure that during any flood event, regardless of the extent or magnitude, the resources of the District can be mobilized into a maximum data collection operation with a minimum of effort.

District streamflow gaging station operations generally are conducted from two offices: the District Office in Montgomery and the Field Office in Tuscaloosa. The following persons are designated as flood activity coordinators for these offices: **Montgomery, James L. Pearman; Tuscaloosa, Victor E. Stricklin.** During localized or routine flood events, field personnel assignments will be made independently by the District or Subdistrict Coordinator. When flood activities require the presence of these persons in the field, personnel assignments will be made by the **alternate District Flood Coordinator, T.S. Hedgecock.** If district or subdistrict personnel cannot adequately monitor a flood, the District Flood Coordinator assigns additional support personnel, as outlined in this plan or as modified for the existing situation.

The flood plan will be updated as required due to changes in personnel, site conditions, and by additional data acquisition.

## FLOOD PERSONNEL

The flood personnel assignments and individual duties are described in **Appendix A and B** of this District Flood Plan.

## COMMUNICATIONS

During flood emergencies, good communication is very important and the telephone will be the primary means of communication. Field personnel will frequently place long-distance calls, and district cellular phones will be used. Each vehicle should be equipped with a cellular phone that has been assigned to a specific individual or checked out from the office pool. Additionally, each person has a Federal Calling Card (FCC) with user instructions printed on the back. The FCC will be used to place FTS 2000 off-net calls. FCC user instructions are included in **Appendix B**, which also contains a list of telephone numbers to assist in maintaining good communications during flood emergencies. The list includes numbers for Alabama District personnel, cellular phones, streamflow stations and for the following offices: Water Resources Division (WRD), National Oceanic and Atmospheric Administration (NOAA), Alabama Power Company, U.S. Army Corps of Engineers, and Tennessee Valley Authority (TVA).

Flood personnel will contact the Flood Coordinator upon completion of assignments and give the following information for each station visited:

- gage height
- time
- rate of change of stage
- Q measurement information (GH and Q, if computed)
- time of peak (if applicable)
- weather and road conditions
- other significant information

A District form, AL- 1 (see **Appendix B**), has been prepared to assist in the compilation of this information. Field personnel will make additional telephone contacts at any time actual field conditions are found to be significantly different from expectations.

Communications with adjacent WRD Districts and with other Federal, State, and municipal agencies will generally be made by the Flood Coordinator. For extraordinary floods, requests for additional personnel and equipment will be made by the District Chief.

Liaison with Division and Regional Headquarters is the responsibility of the District Surface-Water Specialist or other appropriate District personnel. Communications will follow the instructions in WRD Memorandum 90.22 (dated August 25, 1992) and the updated Project Alert section of this document included in **Appendix B**.

## **EQUIPMENT**

A complete set of flood-measuring equipment will be maintained for each regularly assigned vehicle. Sets of emergency equipment will also be maintained for use during extreme flood events when other vehicles must be obtained. Additional vehicles can be obtained on dispatch from the General Services Administration (GSA) Motor Pool or from commercial rental companies if the GSA is unable to meet our needs.

An adequate supply of sediment samplers and bottles will be maintained for use during extreme flood events. Sediment samplers available in the District are of two categories: (1) suspended and (2) bed material. The DH-59 and DH-76 suspended-sediment samplers are the ones routinely used to obtain depth-integrated sediment samples at miscellaneous sites and streamflow gaging stations, as assigned. Other types of suspended-sediment samplers, P-61 and D-49, are assigned to field parties with specific event sampling assignments as indicated by the footnotes to

"Flood Personnel" in **Appendix A**. Bed material samplers, BM-54 and BMH-60, are also assigned to field parties with specific event sampling assignments as indicated in **Appendix A**. Bed material samples generally will **not** be taken during flood events, but, if required, will be at the direction of the Data Section Chief through the Flood Coordinator.

Individual responsibilities of the flood personnel for equipment maintenance are delegated in the "Duties" section of **Appendix A**.

## **DATA NEEDS**

A complete list of sites where flood data are collected and the data needs for each site are listed in **Appendix C**. Each site is assigned a priority based on data needs and the hydrologic characteristics of the site.

## **PROCEDURES**

The procedures as outlined in Techniques of Water-Resources Investigations (TWRI) manuals and Water-Supply Paper 2175, *Measurement and Computation of Streamflow: Volume 1. Measurement of Stage and Discharge* will be followed in collecting streamflow data during floods. Each field person should be familiar with **Appendix D**, which contains information concerning special problems encountered in conventional current-meter measurements and procedures to follow when obtaining miscellaneous or periodic sediment samples at regular streamflow stations during floods. When practical, field personnel will take or obtain photographs showing unusual flood conditions.

## **AERIAL PHOTOGRAPHS**

Federal Emergency Management Agency (FEMA) flood maps and other maps, such as U.S. Geological Survey (USGS) flood prone maps and USGS topographic maps will be used to delineate segments of streams where aerial photographs are desired during, or immediately following, extensive floods.

These maps will be utilized for planning and executing photography flights.

## **POST-FLOOD OPERATIONS**

Data obtained during the flood will be evaluated to determine what data needs were met and what new needs have arisen. This will be done quickly so that follow-up measurements can be made where necessary. Crest stages will be examined to determine sites where indirect measurements should be made, and marking of high-water marks for indirect measurements can be done. Upon completion of follow-up operations, the listing of data needs will be examined and priorities will be reassigned where necessary.

The Flood Coordinator will debrief field personnel to obtain qualitative information such as location of inundated roads, observed damage, and photographs.

## **SAFETY**

Job safety is no more important during flood events than during routine field operations, but there is likely to be more potential for the occurrence of dangerous situations during flood events. These situations may include any or all of the following conditions: swollen streams with swift velocities; turbulent flow; heavy debris; poor visibility; inclement weather; darkness; heavy traffic; wet, slippery roads; or even damaged road surfaces and bridge structures. The personal protective equipment and safety supplies provided to everyone, and safety equipment placed in vehicles for routine data collection activities will generally be sufficient for operations during flood events. The objective of field operations during and following flood events is to safely collect hydrologic data in order to document certain occurrences related to individual flood events. These occurrences include the following: gage height and stream-discharge relation, including peaks; gage height and sediment-discharge relations; and chemical-quality of floodwaters

at specific times. During flood events, data will be obtained by flood parties as assigned.

## **Flood Parties**

Generally, though not always, a flood party will consist of two or more persons. The additional person(s) will provide necessary assistance required for field operations during floods, including improved measures of safety.

## **Communications**

During flood operations the level of communication between the field and office will increase significantly due to the nature of the activity. In addition to communication dictated by daily activities, each flood party is required to communicate with the flood coordinator or his designate at the end of each workday. The contact can be as late as arrival at the motel, office, or home, but should be no earlier than the completion of work at the last site. Concerning this requirement, the flood party and flood coordinator, by mutual agreement, can make other arrangements during the course of daily activities. To assist with the increased level of communication, radio and cellular phones are available. Cellular phones can be used to improve response-time during medical and other emergencies and each flood-party member should be familiar with the use of these phones. Should cellular phones not be available for all flood parties, one-person parties, if there are any, will be given priority. For a listing of radio and cellular phone assignments and related information, see **Appendix B**. During flood events, adjustments in phone assignments will be made by the flood coordinator or his designate.

## **Travel**

Travel is a necessary part of field activity, and routinely may be the most dangerous component of our work schedule. During and following serious flood events, routine hazards of travel may be accompanied by hazardous conditions. These can include any and all of

the following: wet, slippery road surfaces; poor visibility as a result of inclement weather, sunrise, sunset, or darkness of night; roads and bridges inundated by flood waters, or damaged from previous floodwater inundation; roads and bridges obstructed by debris from winds and/or floodwaters; and other vehicles. You should be alert for the existence or possible occurrence of any of these conditions. A reasonable response may be to drive slower and more defensively, remembering that other drivers are subjected to the same conditions and their failures may endanger you. It is important that **your driving be tailored to fit the conditions**. During floods, additional sounding weights may become part of the equipment for individual vehicles. It is important that these **weights be properly secured during travel**.

### **Data Collection**

During floods, streamflow measurements, water-quality samples and sediment samples can be obtained by persons from boats, bridges and cableways; the same as during routine operations. However, the presence of certain conditions can make data collection inherently more dangerous during floods, and flood parties must always be conscious of the existence or possibility of occurrence of these conditions. Activities from boats, bridges, and cableways are all affected by the following conditions: high stream stage; fast velocity; turbulent flow; and debris, including large trees. Large debris is likely the most dangerous hazard and every effort should be made to avoid contact with it because of uncertainty of its size since only a small portion of the material may be exposed. However, the possibility always exists that suspended measuring or sampling equipment may become entangled with debris, especially trees. All reels should be equipped with break-away cables, and the flood crew should always have wire-cutters available for immediate use to cut the suspension cable if necessary. **CUTTING**

**A CABLE IS DANGEROUS.** If you cut a cable, you must be prepared for serious recoil of booms, bases and other pieces of equipment. Cutting a cable when working in a cablecar is especially dangerous. You must be prepared to prevent yourself from being launched like a missile as car returns toward its normal position. Be sure other pieces of equipment are secured, especially the car puller.

When working from a bridge, the crew must be alert to the possibility that bridge abutments may wash-out, or that the structure itself may be washed away. Careful inspection and continuing observation generally will indicate that destruction is occurring. If serious scouring at an abutment(s) becomes obvious, you probably should get off of the bridge. In Alabama during flooding, it is standard operating procedure for the Department of Transportation (DOT) to deny access to bridges when water is on the "low steel", even if there is no evidence of bridge failure. If there is no evidence of bridge damage or failure, and you are certain that the structure is safe, you may have to exert considerable effort to obtain permission to get onto the bridge. It will very likely require approval from the supervisor of the DOT personnel on the site. If you are allowed to work on a bridge closed to the public, traffic is not a problem. However, for a bridge which is open for travel, traffic will be a problem. Inclement weather, poor visibility, and increased volume of traffic may all combine to increase the seriousness of the traffic problem. Traffic volume may increase simply because of human curiosity. There will be many persons crossing the stream just to see what the flood looks like, and the really curious ones will stop to find out what you are doing. You must immediately insist that for the safety of everyone, they should quickly move along. If possible, this should be done courteously; but "whatever it takes".

For dealing with traffic on bridges, there are numerous items available including vehicle flashers and additional emergency flashers, cones, signs, flags, flagmen, and reflective vests. **USE THEM!** In addition, there may be local law enforcement personnel available for assistance. These include city and county police, the county sheriff, and the Alabama Highway Patrol. They are usually willing to provide traffic control during flood work. The blue flashing lights on their vehicles get the attention of others. The DOT should also aid in traffic control.

In the Alabama District, boats are generally not used during severe flooding for making conventional streamflow measurements. However, sediment and water-quality samples are routinely collected using boats on the larger rivers in Alabama, such as the Alabama River and Tombigbee River. Boats are used during flooding to access gaging stations and for other transportation as required. Whether used for data collection or simply for transportation, the operators and occupants of boats must be cognizant of the additional dangers of greater depths, higher velocities, turbulent flow, and floating debris present during flood events. During severe flooding, the Alabama District has the capability to obtain streamflow measurements

via a boat-mounted Acoustic Doppler Current Profiler (ADCP). The crew for this activity generally consists of three persons; a boat operator, a ADCP operator, and a “spotter”. The “spotter” is responsible for watching for floating debris in the channels and for submerged stumps, trees, and other hazards in the overbank sections. The three-person crew seems reasonable and the Alabama District has adopted it as standard operating procedure when using the ADCP during floods.

If used appropriately, personal protective equipment and boat-safety equipment which are routinely provided are sufficient for survival should an accident occur. The appropriate use of your life vest or floater coat is to wear it on your body.

If during normal operations you make proper use of the safety materials, supplies and equipment provided to you and you perform your duties in a safe manner, then safety, relative to flood work, will be just another day in the field. However, you should be aware of conditions that may make field work during floods inherently more dangerous than on routine occasions. Occasional reading of the safety section of this flood plan can assist you in recognizing these conditions and provide a framework for action when they occur.

# ALABAMA DISTRICT FLOOD PLAN - Appendix 1

## FLOOD PERSONNEL

Personnel will be assigned to field parties and geographic areas as required to cover the magnitude of the flood event. Assignments will be made by the Flood Coordinator, James L. Pearman or Alternate Flood Coordinator, T.S. Hedgecock.

## CONTINUING DUTIES

### District Personnel:

During potential flood periods, those who routinely make data-collection field trips of 3 days or more in length will:

(1) prior to departure, obtain some information concerning the long-range weather forecast,

(2) as dictated by the weather forecast, make contact with the district or subdistrict supervisory personnel on day 2 of the trip; additional contacts at the direction of appropriate personnel, and

(3) communicate immediately to the Flood Coordinator all rainfall and stage information that would be helpful in determining the extent and magnitude of possible flooding.

It shall be the responsibility of all personnel to communicate to the Flood Coordinator, immediately from the field, all information relative to flooding.

### Flood Personnel:

Flood party chiefs and individuals with specific flood-event assignments will maintain data collection equipment to be used by them during flooding. The equipment is to include a briefcase containing items such as stop watches, earphones, a steel tape, a tape weight, a flashlight, a calculator, current meter rating tables, a note pad, paper, forms (such as measurement notes and inspection forms), pencils/pens, a copy of Water-Supply Paper 2175, the Alabama District Flood Plan, the latest publication of Water Resources Data for

Alabama, and WRIR 95-4199 (latest flood-frequency reports).

### Montgomery and Tuscaloosa Flood Coordinators:

Montgomery and Tuscaloosa Flood Coordinators furnish to the District Flood Coordinator the information necessary to maintain the lists of gaging station and crest-stage gage measurement needs. They will also see that field crews maintain streamflow-measuring equipment according to Flood Plan instructions.

### Sediment Equipment:

The Montgomery and Tuscaloosa data sections are currently responsible for maintaining an adequate supply of operable suspended and bed-material sediment samplers and related equipment as prescribed by the Flood Plan, ensuring appropriate distribution among Field Headquarters. However, at the current time there is no funding for collection of samples.

### District Flood Coordinator:

The District Flood Coordinator is responsible for ensuring that:

- (1) all flood plan appendices are current,
- (2) appropriate personnel are familiar with the flood plan, and
- (3) personnel with specific continuing duties are meeting their responsibilities.

## FLOOD-EVENT DUTIES

### Flood Coordinator:

The flood coordinator will use all available sources of rainfall and flow information to determine the extent and magnitude of flooding; assign personnel based on initial evaluation of the situation; examine data and other reports as received from the field and modify initial assignments and/or make additional assignments when necessary. Throughout the flood, the coordinator will maintain communications with adjacent

Districts and other Federal, State, and municipal agencies and advise the District staff of existing and forecasted flood conditions. The coordinator will continue to direct activities during follow-up operations until the level of work has returned to normal.

**Alternate Flood Coordinator:**

The Alternate Flood Coordinator will assist the District Flood Coordinator, act as District Flood Coordinator, or perform other duties as may be required.

**Flood Parties:**

Collect data as directed by the Flood Coordinator or alternate, and maintain communications according to Flood Plan instructions.

# ALABAMA DISTRICT FLOOD PLAN - Appendix 2

## COMMUNICATION USER INSTRUCTION

The most common calls by field personnel will be made from Southern Linc radio/phones that have been assigned to each individual. FTS 2001 can be accessed by off-net dialing from commercial stations (pay phones), using MCI calling cards that have been issued to each employee.

### **ALABAMA DISTRICT CELLULAR PHONES**

The District has several cellular phones and all Flood Parties will have a cellular phone, if possible. Most individuals have a radio/phone (numbers provided on previous page). If there is a shortage of phones, more Flood Parties than phones, one-person Parties will have phone-possession priority over multi-person parties. Some cellular phones are assigned to specific individuals and others are maintained in a District Office Pool. It shall be the responsibility of each Flood Party to inform the Flood Coordinator of the phone in its possession. An individual with a permanent assignment will not be required to communicate with the Flood Coordinator unless no one in his Flood Party has a permanently assigned phone.

### **DISTRICT OFFICE POOL CELLULAR PHONES**

(334) 399-4656 (Montgomery)

(205) 799-6669 (Tuscaloosa)

## **STREAMFLOW STATIONS WITH SATELLITE TELEMETRY (<http://water.usgs.gov/>):**

### **CHATTAHOOCHEE RIVER BASIN**

02342500 - Uchee Creek near Fort Mitchell  
02342933 - South Fork Cowikee near Batesville  
0234296910 - Chattahoochee River at Eufaula  
02343801 - Chattahoochee River at Andrews (Pool)  
02343802 - Chattahoochee River at Andrews (Tail)

### **CHOCTAWHATCHEE RIVER BASIN**

02361000 - Choctawhatchee River near Newton  
02361500 - Choctawhatchee River near Bellwood  
02362240 - Little Double Bridges Creek near Enterprise  
02363000 - Pea River near Arifton  
02364000 - Pea River near Elba

### **BLACKWATER RIVER BASIN**

02369800 - Blackwater River near Bradley

### **ESCAMBIA RIVER BASIN**

02371500 - Conecuh River at Brantley  
02372250 - Patsaliga Creek near Brantley  
02372422 - Conecuh River near River Falls  
02373000 - Sepulga River near McKenzie  
02374250 - Conecuh River near Brewton  
02374500 - Murder Creek near Evergreen  
02374700 - Murder Creek at Brewton  
02374745 - Burnt Corn Creek at Highway 41 near Brewton  
02374950 - Big Escambia at Stanley Cross Roads

### **PERDIDO RIVER BASIN**

02376115 - Eleven mile Creek near Pensacola, Florida  
02376500 - Perdido River at Barrineau Park  
02377570 - Styx River near Silverhill

### **FISH RIVER BASIN**

02378300 - Magnolia River at U.S. Highway 98 near Foley  
02378500 - Fish River near Silverhill

### **COOSA RIVER BASIN**

02398037 - Chattooga River at Chattooga, Georgia  
02398250 - Mills Creek at Dewey  
02398300 - Chattooga River near Gaylesville  
02398950 - West Fork Little River near Fort Payne  
02399200 - Little River near Blue Pond  
02399500 - Coosa River at Leesburg  
02400100 - Terrapin Creek at Ellisville  
02400496 - Coosa River at Steamplant near Gadsden  
02400500 - Coosa River at Gadsden  
02401000 - Big Wills Creek near Reece City

## **STREAMFLOW STATIONS WITH SATELLITE TELEMETRY (continued):**

02401390 - Big Canoe Creek at Ashville  
02403395 - Choccolocco Creek at Oxford  
02404400 - Choccolocco Creek near Lincoln  
02405500 - Kelly Creek near Vincent  
02406500 - Talladega Creek at Alpine  
02407000 - Coosa River at Childersburg  
02407526 - Coosa River at Steamplant near Wilsonville  
02408540 - Hatchet Creek below Rockford  
02411600 - Coosa River at Wetumpka

### **TALLAPOOSA RIVER BASIN**

02411930 - Tallapoosa River below Tallapoosa, Georgia  
02412000 - Tallapoosa River near Heflin  
02413210 - Little Tallapoosa River below Bowdon  
02413300 - Little Tallapoosa River near Newell  
02414500 - Tallapoosa River at Wadley  
02414715 - Tallapoosa river near New Site  
02415000 - Hillabee Creek near Hackneyville  
02418230 - Sougahatchee Creek near Loachapoka  
02419000 - Uphabee Creek near Tuskegee  
02419500 - Tallapoosa River at Milstead  
02419890 - Tallapoosa River near Montgomery (Montgomery water plant)

### **UPPER ALABAMA RIVER BASIN**

02419988 - Alabama River at Montgomery  
02420000 - Alabama River at U.S. Highway 31 near Montgomery  
02421000 - Catoma Creek near Montgomery  
02421350 - Alabama River at Jones Bluff (Pool)  
02421351 - Alabama River at Jones Bluff (Tail)  
02422500 - Mulberry Creek at Jones  
02423000 - Alabama River at Selma

### **CAHABA RIVER BASIN**

02423130 - Cahaba River at Trussville  
02423380 - Cahaba River near Mountain Brook  
02423397 - Little Cahaba River below Leeds  
02423398 - Little Cahaba River near Leeds  
02423425 - Cahaba River near Cahaba Heights  
02423496 - Cahaba River near Hoover  
02423500 - Cahaba River near Acton  
0242354750 - Cahaba Valley Creek at Pelham  
02423555 - Cahaba River near Helena  
02423586 - Shades Creek near Homewood  
02423630 - Shades Creek near Greenwood  
02424000 - Cahaba River at Centreville

## **STREAMFLOW STATIONS WITH SATELLITE TELEMETRY (continued):**

02424590 - Cahaba River near Suttle

02425000 - Cahaba River near Marion Junction

### **LOWER ALABAMA RIVER BASIN**

02427250 - Pine Barren Creek near Snow Hill

02427505 - Alabama River Miller Ferry (Pool)

02427506 - Alabama River Miller Ferry (Tail)

02428400 - Alabama River near Claiborne (Pool)

02428401 - Alabama River near Claiborne (Tail)

02429540 - Alabama River at Choctaw Bluff near Carl

### **UPPER TOMBIGBEE RIVER BASIN**

02438000 - Buttahatchee River below Hamilton

02442500 - Luxapallila Creek at Millport

02444160 - Tombigbee at Pickensville (Pool)

02444161 - Tombigbee at Pickensville (Tail)

02444490 - Bogue Chitto Creek near Memphis

02444500 - Tombigbee River near Cochrane

02446500 - Sipsev River near Elrod

02447025 - Tombigbee at Gainesville (Pool)

02447026 - Tombigbee at Gainesville (Tail)

02448500 - Noxubee River near Geiger

02448900 - Bodka Creek near Geiger

### **MULBERRY FORK BASIN**

02449840 - Duck River near Berlin

02449882 - Blue Springs Creek near Blountsville

02450000 - Mulberry Fork near Garden City

02450180 - Mulberry Fork near Arkadelphia

02450250 - Sipsev Fork near Grayson

02450825 - Clear Creek near Poplar Springs

02453000 - Blackwater Creek near Manchester

02453500 - Mulberry Fork at Cordova

02454055 - Lost Creek above Parrish

### **LOCUST FORK BASIN**

02455000 - Locust Fork near Cleveland

02455900 - Locust Fork at Warrior

02455980 - Turkey Creek near Pinson

02456000 - Turkey Creek at Morris

02456500 - Locust Fork at Sayre

02457000 - Fivemile Creek at Ketona

02457595 - Fivemile Creek at Republic

02457670 - Fivemile Creek near Graysville

02458148 - Village Creek at 86th Street at Roebuck

02458200 - Village Creek at Apalachee Street at Birmingham

## **STREAMFLOW STATIONS WITH SATELLITE TELEMETRY (continued):**

02458300 - Village Creek at 24th Street at Birmingham

02458450 - Village Creek at Avenue W near Ensley

02458502 - Village Creek near Pratt City

02458600 - Village Creek near Docena

### **BLACK WARRIOR RIVER BASIN**

02461130 - Valley Creek at Birmingham

02461500 - Valley Creek near Bessemer

02461630 - Halls Creek at Bessemer

02461640 - Valley Creek at Bessemer

02462000 - Valley Creek near Oak Grove

02462500 - Black Warrior River at Bankhead (Pool)

02462501 - Black Warrior River at Bankhead (Tail)

02462951 - Black Warrior at Holt (Pool)

02462952 - Black Warrior at Holt (Tail)

02464000 - North River near Samantha

02464146 - Turkey Creek near Tuscaloosa

02464800 - Lake Tuscaloosa near Tuscaloosa

02465000 - Black Warrior River above Oliver Dam (Pool)

02465005 - Black Warrior River below Oliver Dam (Tail)

02465292 - Cribbs Mill Creek at Tuscaloosa

02465493 - Elliotts Creek at Moundville

02466030 - Black Warrior River near Eutaw (Pool)

02466031 - Black Warrior River near Eutaw (Tail)

### **LOWER TOMBIGBEE RIVER BASIN**

02467000 - Tombigbee River at Demopolis (Pool)

02467001 - Tombigbee River at Demopolis (Tail)

02467500 - Sucarnoochee River at Livingston

02469525 - Tombigbee River near Nanafalia

02469761 - Tombigbee River at Coffeeville (Pool)

02469762 - Tombigbee River at Coffeeville (Tail)

02469800 - Satilpa Creek at Coffeeville

02470050 - Tombigbee River near Leroy

02470072 - Bassett Creek near Thomasville

### **MOBILE RIVER BASIN**

02471001 - Chickasaw Creek near Kushla

02471013 - Threemile Creek at Ziegler Blvd.

0247101490 - Threemile Creek at Mobile

02471016 - Threemile Creek near Prichard

02471017 - Mobile River at State Docks at Mobile

02471078 - Fowl River near Laurendin

## **STREAMFLOW STATIONS WITH SATELLITE TELEMETRY (continued):**

### **PASCAGOULA RIVER BASIN**

02479560 - Escatawpa River near Agricola, Mississippi

02479945 - Big Creek near Wilmer

02479980 - Crooked Creek near Fairview

02480004 - J.B. Converse Reservoir near Semmes

### **UPPER TENNESSEE RIVER BASIN**

03573182 - Scarham Creek near McVille

03574500 - Paint Rock River at Woodville

0357526200 - Big Cove Creek near Huntsville

03575500 - Tennessee River at Whitesburg

0357568650 - Aldridge Creek at Toney Drive at Huntsville

0357568980 - Aldridge Creek at Sherwood Drive at Huntsville

03575700 - Aldridge Creek near Farley

03575830 - Indian Creek near Madison

0357586650 - Fagan Creek at Adams Street at Huntsville

0357587090 - West Fork Pinhook Blue Spring Road at Huntsville

0357587140 - East Fork Pinhook Creek at Winche Road at Huntsville

0357587400 - Pinhook Creek at Mastin Lake Road at Huntsville

0357587728 - Dallas Branch at Coleman Street at Huntsville

03575890 - Pinhook Creek at Clinton Avenue at Huntsville

0357591500 - Broglan Branch at Oakwood Avenue at Huntsville

03575933 - Broglan Branch at Clinton Avenue at Huntsville

## PROJECT ALERT (WRD Memorandum 90.22)

The purpose of Project Alert is to notify U.S. Geological Survey and Department of the Interior officials of significant or unusual hydrologic events so that they may disseminate information about the event to the news media and arrange for emergency operations, if necessary.

Descriptions of significant or unusual water events of interest should include the following:

- Floods and the imminent threat of floods--Information should include all of those data shown on the attached form, used for the National Water Conditions. **If all information is not readily available, prompt reporting is more important; additional information can be relayed later.** This report format does fit electronic mail -- California, Nevada, Virginia, West Virginia, and other States used it to submit data for floods which affected many sites in those States in the last several years (Note that when a peak discharge exceeds that for the 100-year flood, the ratio of the peak discharge to that of the 100-year flood should be furnished). Flood forecasts, rainfall data, and damage estimates are helpful for background. Floods with recurrence intervals of less than 10 years are not to be reported unless lives are lost or damages are widespread or sizable (in the hundreds or thousands of dollars). Information desired by the Public Affairs Office for record-high or near-record-high streamflows or where damages are newsworthy is shown on page A4 of this attachment.
- Lake and reservoir levels--Extremely high or low water levels and associated effects on shorelines, water quality, or water supplies.
- Droughts--Location and extent of areas affected by persistent low flows, low reservoir levels, declining ground-water levels, and dry soil moisture conditions that may restrict water use and affect crops and wildlife. Provisional data should include date, stream name and location, gaging station number, discharge, drainage area, recurrence interval, and comparative ranking with previous low flows. Data on rainfall, soil moisture conditions, and damage estimates are helpful for background. Descriptions of emergency actions taken by local agencies to conserve water, reduce demand, or obtain emergency supplies also will help put the event in perspective.
- Toxic and radiological spills--Reports of significant toxic and radiological spills in waterways, lakes, reservoirs, and on the ground should include date, water body name, location and nature of spill, amount of spill, water supplies endangered, and cleanup actions being taken. Effects might include fish kills, temporary closing of water-treatment plants downstream from the spills, closing of water bodies to swimming or fishing, or closing of wells.
- Ground-water levels--Location and extent of unusually high or low ground-water levels and their effects.
- Ground-water contamination--Reports of newly discovered ground-water contamination should include date of discovery, well location, contaminant, extent of contamination, and actions being taken such as the closing of wells or well fields. Population affected by the closure of a water-supply well would be useful for background interest. Contaminants include, but are not limited to, salt, radioactive materials, petroleum products, organics, trace metals, nitrates, and bacteria.

**Other water-related events of unusual severity that should be reported include, but are not limited to, ice jams, mudflows, and subsidence. If an event is determined to be newsworthy, then speed in reporting the event is essential.**

**To facilitate the flow of information, the following actions should be taken:**

- (1) As soon as preliminary data are available, they should be entered on the Project Alert Web Page: [water.usgs.gov/project\\_alert](http://water.usgs.gov/project_alert) and follow the instructions on that page, or**
- (2) fax information to (703) 648-5295. Use forms on pages B-35 and B-36 for types of data needed to report to Headquarters, or**
- (3) email information to: [project\\_alert@usgs.gov](mailto:project_alert@usgs.gov)**

## FLOOD NEWS REPORT FORM FOR USE BY USGS PUBLIC AFFAIRS OFFICE

1. WRD DISTRICT/STATE \_\_\_\_\_ DATE \_\_\_\_\_

2. NAME OF PREPARER \_\_\_\_\_  
TELEPHONE NUMBER \_\_\_\_\_

3. NAME OF STREAM \_\_\_\_\_

4. LOCATION OF GAGE \_\_\_\_\_

5. PEAK STREAMFLOW IN CFS \_\_\_\_\_  
RECURRENCE INTERVAL (YEARS, OR RATIO TO 100-YEAR FLOOD IF > 100 YEARS) \_\_\_\_\_  
DATE OF PEAK \_\_\_\_\_

6. IS THIS A NEW PEAK OF RECORD? NO YES (SKIP 7)

7. LAST TIME THIS FLOW WAS EXCEEDED: DATE \_\_\_\_\_  
(IF CURRENT PEAK IS NOT PEAK OF RECORD) FLOW IN CFS \_\_\_\_\_

8. AT THE TIME OF MEASUREMENT/READING, FLOW WAS: AT ITS PEAK \_\_\_\_\_  
(CHECK ONE IF DISCHARGE MEASUREMENT OR INCREASING \_\_\_\_\_  
NON-PEAK FLOW IS BEING REPORTED) DECREASING \_\_\_\_\_

9. PREVIOUS RECORD HIGH:  
FLOW IN CFS \_\_\_\_\_ DATE \_\_\_\_\_  
STAGE IN FEET \_\_\_\_\_ DATE \_\_\_\_\_ (IF NOT CONCURRENT  
WITH PEAK FLOW)

10. OTHER INFORMATION: \_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_  
\_\_\_\_\_

NOTE: When reporting streamflow for a flood, give at least the highest flow/stage which has occurred so far. This information is always important but is of particular interest if the previous record high has been exceeded, even if flow has not yet peaked. Also, data indicating how flow is changing, both before and after the peak occurs, is important when reporting major floods on large rivers.

## SPECIAL PROBLEMS IN CONVENTIONAL CURRENT-METER MEASUREMENTS:

### MEASUREMENT OF DEEP, SWIFT STREAMS

Measurement of deep swift streams presents no serious problems when a sounding weight of sufficient size is available and there is not an excessive amount of drift and/or ice flowing in the stream. However, there are times when it is necessary to alter our normal stream gaging procedures when gaging deep swift streams. The six most common circumstances are listed below:

1. Able to sound but weight and meter drift downstream.
2. Cannot sound; standard cross section available.
3. Cannot sound; standard cross section not available.
4. Cannot put meter in water.
5. Measurements during rapidly changing stage.
6. Series of measurements needed during a peak of short duration.

The procedures outlined for items 2, 3, and 4 above assume that there is a stable cross section. At stations with unstable channels it is necessary to decide on a procedure based on the situation at each station.

1. The first item, when measuring where soundings can be obtained but the weight and meter drift downstream, is adequately covered on pages 159-170 of Volume I of WSP 2175. The use of tags on the sounding line and stay lines is also discussed.

2. The procedure to follow when measuring where a standard cross section is available, but where it is impossible to make soundings, is:

- A. Determine the depths from the standard cross section.

- B. Measure the velocity at the 0.2 depth.

- C. Determine coefficients to adjust the 0.2 depth velocities to the mean velocity in the vertical on the basis of previous measurements made by the 0.2 and 0.8 depth method.

- D. Compute the measurement in the normal manner using the depths from the standard cross section and the velocities as adjusted in step C.

3. The procedure to follow when measuring where it is impossible to obtain soundings and a standard cross section is not available is:

- A. Reference the water-surface elevation before and after the measurement to an RP on a bridge or a driven stake or tree along the water's edge.

- B. Estimate the depths and observe the velocity at 0.2 of the estimated depth. The meter should be at least 2.0 feet below the water surface. The actual depth the meter was placed below the water surface should be recorded in the notes. If an estimate of the depth is impossible just place the meter 2.0 feet below the water surface and observe the velocity there.

- C. Make a complete measurement, including some vertical velocity curves, at a lower stage.

- D. Use the complete measurement and difference in stage between the two measurements to determine the cross section of the first measurement.

- E. Use vertical velocity curves to determine coefficients to adjust the velocities observed in step B to mean velocity.

- F. Compute the measurement in the normal manner using the depths from step D and the velocities from step E.

4. The procedure to follow when measuring where it is impossible to keep the weight and meter in the water is:

- A. Repeat step A in procedure 3.
- B. Measure surface velocities by timing floating drift.
- C. Repeat steps C, D, E, and F in procedure 3.

It should be remembered that just after the crest the amount of floating drift or ice will usually be greatly reduced and it may be possible to obtain velocity observations with a current meter. If this condition appears probable it would be best to omit the float measurement and make a current-meter measurement at a slightly lower stage.

5. During periods of rapidly changing stage, measurements should be made as quickly as possible to keep the change in stage to a minimum. The procedure to follow to speed up a measurement is:

- A. Use the 0.6 depth method. The 0.2 depth method or the subsurface method could be used if placing the meter at the 0.6 depth creates vertical angles and thus wastes time because air and water depth corrections have to be made.
- B. Reduce the velocity observation time to about 20-30 seconds.
- C. Reduce the number of sections taken to about 15-18.

By incorporating all three of the above practices a measurement very often can be made in 15 to 20 minutes. If the subsurface method for observing velocities is used, then some vertical velocity curves will be needed later to establish coefficients to convert observed velocity to mean velocity.

Anderson (1961) has shown that the discharge measurement error for a 45-second period of observation, the 0.2 depth and 0.8 depth method of velocity observation, and depth and velocity observed at 25 locations is 2.2 percent. This means that two-thirds of the measurements made using this procedure would be in error by 2.2 percent or less. Using Anderson's data, the error for a 25-second period of observation, the 0.6 depth method of velocity observation, and depth and velocity observed at 16 locations is 4.2 percent. This slight increase in error due to using the short-cut methods suggested in procedure (5) is more than offset by the reduction in accuracy that would be caused by excessive change in stage during the time required to make a normal measurement.

6. The procedure to follow if a series of measurements is wanted during a peak of short duration is:

- A. Take about 10 sections.
- B. Take velocity observations at 0.6 depth.
- C. Repeat velocity and depth observations at the 10 sections as often as possible throughout the period of the flood wave.
- D. Develop stage-velocity and stage-depth curves for each of the 10 sections.
- E. Compute the discharge corresponding to any stage from the curves thus defined.

## EQUIPMENT REQUIREMENTS

Current meters - Price AA (2)  
Headphones (2)  
Stop watches (2)  
Tagline reel (Lee-Au 500 ft.)  
Protractor  
Reel (B56 or B50)  
Spare cable and connector for reel  
Sounding weight (30c, 50c, 75c, 100c)  
Spare hanger for reel  
Weight pins (30c, 75c, 100c)  
Tool box  
Water-level measurement steel tape  
Wading rod  
  
Hip boots  
Waders  
Raincoat or rainsuit  
Rainhat  
  
Thermometer  
Sample bottles  
  
Life Jacket  
Safety equipment for traffic

Flashlight  
Camera  
Stakes, nails, and flagging for high water marks  
Hatchet  
Hand level  
Rope  
  
Flood note measurement sheets  
Pencils  
Calculator  
Airline and wetline correction table  
Current meter rating tables  
Copy of district flood plan  
Field folders  
TWRI Book3, Chapter A8  
  
Flood note measurement sheets  
Pencils  
Calculator  
Airline and wetline correction table
