INTRODUCTION

The Hawaiian Volcano Observatory (HVO) summary presents seismic data gathered during the year and a chronological narrative describing the volcanic events. The seismic summary is offered without interpretation as a source of preliminary data. It is complete in the sense that most data for events of $M \geq 1.5$ routinely gathered by the Observatory are included. The emphasis in collection of tilt and deformation data has shifted from quarterly measurements at a few water-tube tilt stations ("wet" tilt) to a larger number of continuously recording borehole tiltmeters, repeated measurements at numerous spirit-level tilt stations ("dry" tilt), and surveying of level and trilateration networks. Because of the large quantity of deformation data now gathered and differing schedules of data reduction, the seismic and deformation summaries are published separately.

The HVO summaries have been published in various forms since 1956. Summaries prior to 1974 were issued quarterly, but cost, convenience of preparation and distribution, and the large quantities of data dictated an annual publication beginning with Summary 74 for the year 1974. Summary 86 (the introduction of CUSP at HVO) includes a description of the seismic instrumentation, calibration, and processing used in recent years. The present summary includes background information on the seismic network and processing to allow use of the data and to provide an understanding of how they were gathered.

A report by Klein and Koyanagi (1980) [1] tabulating instrumentation, calibration, and recording history of each seismic station in the network. It is designed as a reference for users of seismograms and phase data and includes and augments the information in the station table in this summary.

CHRONOLOGICAL SUMMARY 2002
by

C. Heliker, T. Orr, and R. Hoblitt

Statistics

Lava covered 9.6 km^2 in 2002, 6.9 km^2 of which was virgin, vegetated land. The total area covered by lava since 1983 is 112.1 km^2, and the volume of lava is approximately 2.4 km^3 (dense rock equivalent). For the latest statistics, refer to table G-2.

No pauses in magma supply to the Pu‘u ‘O‘o flank vent(s) occurred in 2002 (table G-3). In addition to the Mother’s Day event, however, several other events perturbed the eruption. Three tilt events that were local to Pu‘u ‘O‘o triggered increased activity in the crater and shield area, as did a surge-style event initiated at the summit on April 5–6.

Whole-rock MgO showed no significant change throughout 2002. Eruption temperatures showed more scatter—mainly because of frequent changes in sampling sites and methods through the year—but no consistent trends.

Flows, rootless shields, and hornitos

The tube/flow system that began after a pause in December 2000 finally broke down in January 2002. During this two-year interval, a stable tube led from the flank vent(s) on the southwest side of Pu‘u ‘O‘o cone to the top of Pulama pali, producing a series of overlapping surface flows that were mapped as a single expanding unit through January 2002 (see December 2001–January 2002 report).

The upper reaches of this tube persisted into 2002, but the flow activity began to change significantly in early December 2001, when persistent breakouts began between the 2,300- and 2,000-ft elevations. Within a month, the lower half of the tube system, which included two main branches feeding ocean entries at East Kupapa‘u and Kamoamoa, was stagnating. Concurrently, the breakouts high on the tube grew in number and output, and, by the end of March, eight rootless shields formed a continuous ridge, 2.7 km long and up to 1.5 km wide, between the 2,250- and 2,000-ft elevations (fig. G-6). Several pahoehoe breakout areas developed at the lower end of the rootless shield field—on both the Kamoamoa and Ocean entry tubes—that were not quite shields but failed to produce any long flows.

This was the longest of only two periods of rootless-shield building during this eruption. The first, in September–November 1999, seemed to be occur in response to irregular lava supply through the tubes due to a succession of eruptive pauses. The 2002 crop of shields, however, is more puzzling. First, we don’t know what caused the lower part of the tube system to atrophy. The magma supply apparently waned during this period (see Geophysics section, February–March 2003 report), but a prolonged and well-documented period of reduced supply during 1991 did not produce rootless shields.

Hornitos are another piece of the rootless shield puzzle. A fantastic crop formed in the first three months of 2002—more than the sum total of the previous 19 years of eruption—and these were by far the largest specimens, with several in the 8-to-12-m-high bracket. Both the hornitos and the rootless shields require a full tube to form, a condition that was met during January–March 2002. Then the lower end of the tube had stagnated, and the breakouts that built the rootless shields, even though fluid pahoehoe, did not flow long or far enough from their source to form new tubes.

The rootless shield activity declined during the last half of April. Between April 25 and April 30, two substantial flows (HALP and Boundary, fig. G-6) had struck out from the line of rootless shields and advanced rapidly to the southeast, both progressing more than 2 km within a few days. This resumption of “normal” flow behavior was relatively abrupt and did not correspond to a long-term change in lava flux (see Geophysics section, April–May 2002 report). It may have been triggered by a short-term increase in flux associated with the April 23–24 tilt event, local to Pu`u `O`o, which caused 10 mrad of inflation at POC, followed by gradual deflation that continued until about April 28. This event initiated several days of heightened activity in the crater of Pu`u `O`o that ended late on April 27.

The HALP flow soon entered the remains of the Royal Gardens subdivision and in late May claimed the only structure of 2002, a long-abandoned house on Ekaha Street. The HALP flow continued its advance through Royal Gardens until June 14 and stagnated completely by July 5. The Boundary flow was active through August 19, though activity was much diminished after the Mother's Day flow began (see below). The tube that fed these flows was declared dead at the end of August 2002 (see Geophysics section, August–September 2002 report).

Mother's Day flow

On May 12, the Mother's Day flow broke out on the west flank of the episode 50–55 shield (fig. G-5 and G-6) as the POC tiltmeter recorded more than 18 microradians of deflation. The summit also responded to this event but lagged behind POC and recorded only about 2 microradians at UWE. GPS data show that the active magmatic system of Kilauea, from the summit down the east rift zone to at least Pu'u 'O'o, began to inflate sometime between mid-November 2001 and January 2002, which may have been the reason for the decline in lava flux early in 2002. The rate of inflation at the summit and on the east rift zone did not immediately turn over after May 12, as we might have expected if the Mother's Day breakout represented magma stored in the rift zone. Instead, the rate of inflation slowed after May 12, flattened in June, and finally turned over in July.

Initially, a line of steam plumes headed upslope from the source of the Mother's Day flow toward the 55 cone/pit–Puka Nui area (fig. G-5). VLF measurements taken by Jim Kauahikaua on May 17 over the steaming area suggested that a shallow tube was feeding the source. Subsequent VLF measurements farther upslope, however, failed to find an active tube that could be traced upslope to known flank vents in the West Gap or Puka Nui areas. Probably the Mother's Day flow is fed by a new flank vent that intercepted an old (early episode 55) tube in the shield.

The new flow advanced down the west margin of the flow field, sparking forest fires and reaching the ocean at West Highcastle on July 19. The subsequent ocean entries are listed in table G-4 and shown on fig. G-2. The Mother's Day flow continued through the end of 2002.

Pu'u 'O'o crater

On January 22, a small tilt event recorded only on POC initiated the first crater activity of the year, and flows repaved the inner trough on the crater floor with pahoehoe. During February, the inner trough slowly filled, with small flows contributed by most of the vents shown in fig. G-5. In the last week of February, lava overflowed the trough, and by the end of March, only a thin slice of the old 1999 terrace was still visible below the West Gap. Crater activity surged during the two tilt events in April, producing a lava pond at the east end of the crater, fed mainly by the East Pond and January vents.

By the end of April, the crater floor had risen to within 12 m of the east rim, and the top of the highest cone, at the East Pond vent, was only 3.7 m below the east rim. In May, the crater activity diminished to a few bouts of spattering. Thereafter, only a single short lava flow, on July 2, was active in the crater for the remainder of the year.

West Gap

On March 8, a new spatter cone, perched halfway up the southeast wall of the 55 cone/pit (fig. G-5), was intermittently feeding a thin stream of pahoehoe that ran down to the bottom of the pit. At the end of March, a new pad of pahoehoe floored the West Gap Pit, the first activity in this pit since 2001. At the same time, an active lava pond filled the 55 cone/pit to within 10 m of its low northwest rim. The new pond waxed and waned through mid-April and was briefly rejuvenated during the Mothers' Day event, when it overtopped its east and north rims. By May 17, it was inactive and remained so for the rest of the year.

On April 11, the spatter cone that hugs the west wall of the West Gap Pit fed flows that formed a pond a few meters deep. Several hours later, the pond drained, then partially refilled. By the following day, it was inactive. A 10-m-high hornito formed over the spatter cone in the West Gap pit in May, probably on Mother's Day.

Puka Nui

Puka Nui hosted a small lava pond within an inner collapse pit for a week in March, then lapsed into inactivity until the surge of April 6, which produced the first overflow from Puka Nui since late 1999. The new flow extended about 800 m to the south-southeast. Three small spatter cones formed inside Puka Nui at this time, all along the trace of the cone-shield contact (fig. G-5). By mid-April, a larger spatter cone had formed near the center of Puka Nui; this cone appeared to be the source of the flows that continued to issue from Puka Nui through mid-May. The last activity probably occurred on May 12; by the following week the flows were stagnant.

Table C-1. Eruption Statistics

Areas

Total area covered by lava, 3/83–12/31/02: **112.1 km²** (43.3 mi²)

Episode	Area originally covered	Area exposed, 12/31/02
1–48b (mostly Pu'u 'O'o)	42.0 km²	17.3 km²
48 (Kupaianaha)	41.0	34.7
49 (between Pu'u 'O'o & Kupaianaha)	3.9	3.9
50 (Pu'u 'O'o flank vents)	1.0	0.2
51–52 (Pu'u 'O'o flank vents)	12.3	0.8
53 (Pu'u 'O'o flank vents)	19.4	8.4
54 (in & NE of Napau Crater)	0.24	0.24
55 (Pu'u 'O'o flank vents)	46.6	46.6

New (vegetated) territory covered in 2002: **6.9 km²**

Net total of new land created, Nov 86–Dec. 2002: **225 hectares** (561 acres)**#**
Net new land created during 2002: ~**12.8 hectares** (31.6 acres**)**
#These figures do not include new land that was claimed by wave erosion or collapse of the active lava bench. Due to these processes, mapping in 1998 and 1999 revealed a decrease in total acreage.

Volumes

Total, 1/83 through 12/02. Approximately: **2.4 km³** (dense rock equivalent)

Episodes 1–48b (1/83 - 6/86)	**391 x 10⁶ m³**
Episode 48 (7/86–2/92)	**500 x 10⁶ m³**
Episode 49 (11/91)	**11 x 10⁶ m³**
Episode 50 (2/92–3/92)	**4.5 x 10⁶ m³**
Episode 51-52 (3/92–2/93)	**78 x 10⁶ m³**
Episode 53 (2/93–1/97)	**535 x 10⁶ m³**
Episode 54 (1/97)	**0.3 x 10⁶ m³**
Episode 55 (2/97– ongoing)	**833 x 10⁶ m³**

Other fascinating facts

Height of Pu'u 'O'o cone: **~187 m** (613 ft). Cone has lost **~68 m** (223 ft) to collapse since 1986
Dimensions of Pu'u 'O'o crater: ~**250 m x 400 m** (820 x 1312)
Depth of Pu'u 'O'o crater floor below east rim, Dec 2002: **~12 m**

Dimensions of episode 50–55 lava shield: ~ **1.8 x 0.8 km**
Height of episode 50–55 lava shield: **~80 m**

Height of Kupaianaha lava shield: **56 m (**Kupaianaha vent inactive since Feb 92)

Thickness of lava at the coast:
~**15-35 m** (33–115 ft) over Chain of Craters Rd/Hwy 130
Highway covered by lava flows from this eruption: **13.7 km** (8.5 mi)

Structures destroyed

Structures destroyed in 2002: **1** (upper Royal Gardens)
Total structures destroyed since 1983: **189**

Table C-2. Episode 55 eruptive pauses and other magmatic events through December 2002.

Episode 55 pause no. or magmatic event	Start date & time, H.s.t.		End date & time, H.s.t.		Length, hours
1	5/03/97	0000	5/03/97	0530	5.5
2	5/10/97	0700	5/10/97	1230	5.5
3	5/11/97	2000	5/12/97	0600	10
4	5/12/97	2139	5/13/98	0030	3
5	5/14/97	0200	5/14/97	0700	5
6	5/23/97	0630	5/23/97	2134	15
7	5/27/97	0430	5/27/97	0654	2.5
8	6/06/97	2330	6/07/97	1005	10.5
9	6/16/97	1600	6/16/92	2027	4.5
10	6/17/97	1010	6/18/97	~0530	19.5
11	1/15/98	1030	1/16/98	1100	24.5
12	1/26/98	1130	1/27/98	0600	18.5
13	2/21/98	0000	2/21/98	2400	24
14	3/02/98	0400	3/02/98	1600	12
15	3/09/98	1400	3/10/98	0800	8
16	4/04/98	0400	4/05/98	0041	20.5
17	5/19/98	0350	5/20/98	2230	42.5
18	6/19/98	~1400	6/20/98	~0100	11
19	7/16/98	2100	7/19/98	0200	53
20	8/12/98	~1500	8/14/98	~0930	42
21	11/07/98	~0600	11/08/98	~1000	28
22	2/06/99	0400-0800	2/07/99	~0300	19–23
23	5/04/99	~1300	5/05/99	~2200	33
24	6/14/99	0010	6/17/99	2300	95
25	8/21/99	~2000	8/22/99	~2000	24
26 INTRUSION	9/12/99	0131	9/23/99	1100	273.5
27	10/03/99	~2200	0/05/99	0900	35
28	11/07/99	1400	11/08/99	1015	20.25
29	11/11/99	~1530	11/14/99	1030	67
INTRUSION	2/23/00	1342	NO PAUSE		
30	8/23/00	~2300	8/26/00	~1900	68
Dog Day surge	9/24/00		9/25/00		
31	12/15/00	1715	12/17/00	~0200	~33
SLOWDOWN	4/05/01		4/08/01		
Surge	5/20/01		5/23/01		Two summit tilt cycles
Pu‘u ‘O‘o /summit	8/25/01		8/25/01		Small crater-floor collapse
Summit event	12/08/01		12/10/01		No effect on eruption
Pu‘u ‘O‘o tilt	1/22/02		1/22/02		Lava flows in crater
Pu‘u ‘O‘o tilt	2/10/02	1149	2/10/02	1600	Increase in crater activity
Surge	4/05/02		4/06/02		Increase in crater/cone activity
Pu‘u ‘O‘o tilt	4/23/02		4/24/02		Increase in crater/cone activity
Mother’s Day event	5/12/02				New flank vent, high lava-flux rate

Table C-3. Ocean entries, from west to east, active during 2002. Dimensions and areas for Kamoamoa and East Kupapa'u are for January 2002, rather than end of year.

Ocean entry	Dates of activity	End of year bench dimension	End of year bench area (hectares)	Maximum bench area (hectares)
Wilipe'a	Jul. 21-Aug. 8, Aug. 11, 14, 16, Sep. 3-Dec. 31	750 x 100 m	5.4	14.8
West Highcastle	Jul. 19-Aug.2, Aug. 7, Aug. 13, Sep. 16-18, Sep. 20-Dec. 31	800 x 150 m	6.2	10.7
Highcastle	Aug. 8-15, Aug 20-24, Sep. 20-21, Oct. 29, Nov. 11-21, Dec. 9-31	290 x 60 m	1.2	1.3
West Lae'apuki	Nov. 19-24	Not mappable	Not mappable	Tiny
Lae'apuki	Nov. 20-28	98 x 12 m	<0.1	0.2
Kamoamoa	Sep. 27, 2001-Jan. 30, 2002	490 x 130 m	3.1	3.1
East Kupapa'u	Apr. 25, 2001-Jan. 22, 2002	600 x 120 m	3.9	3.9

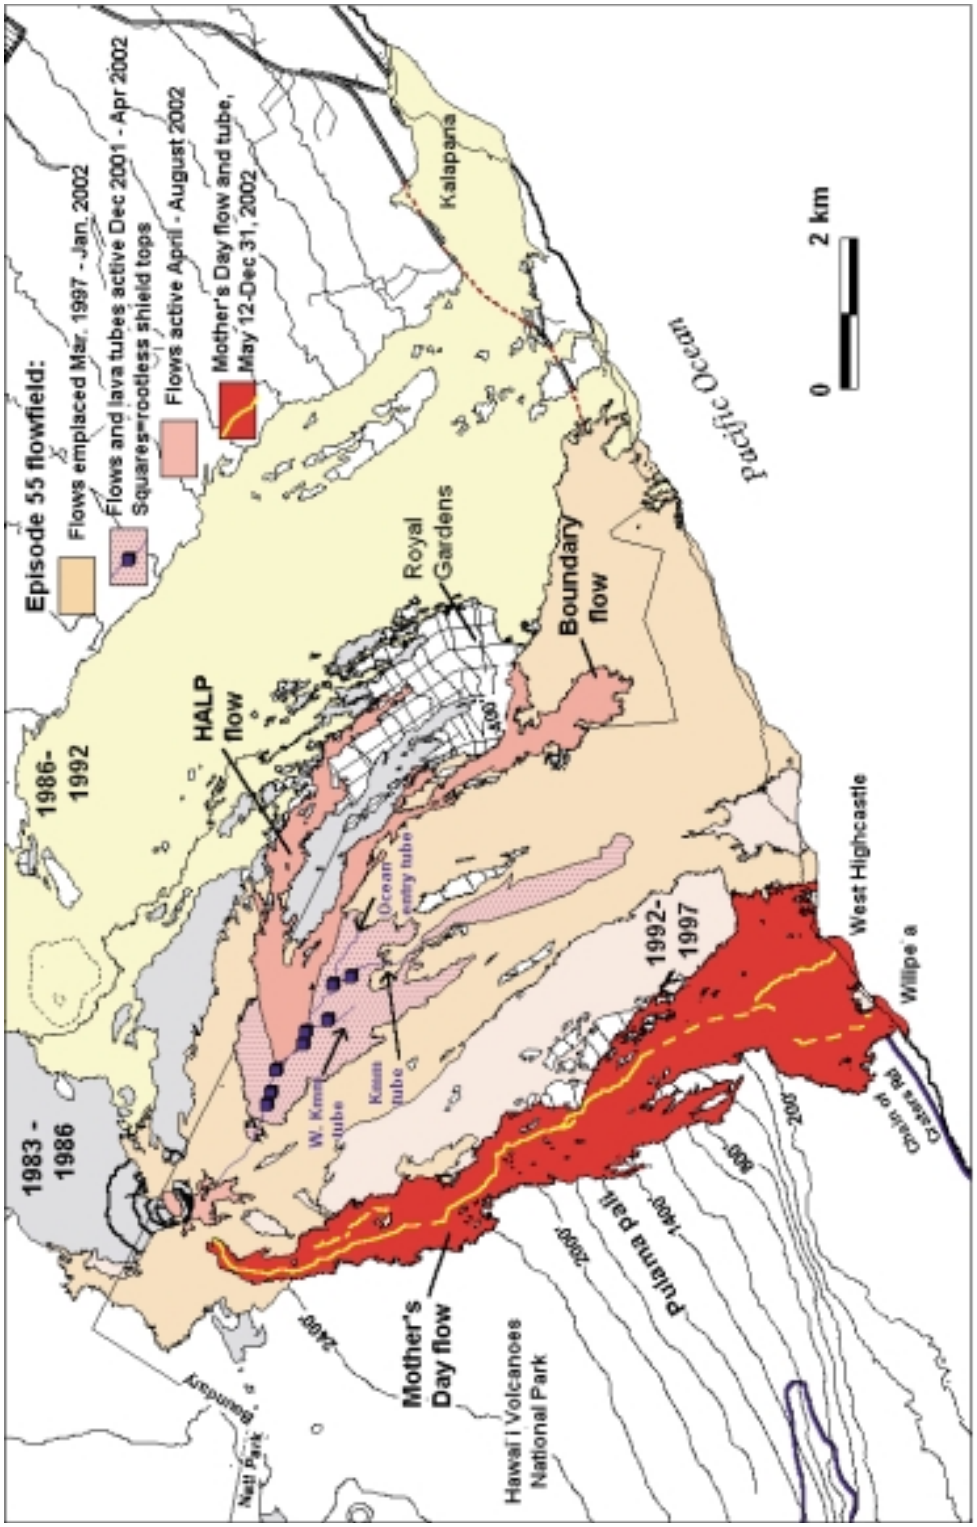

Figure C-1. The eruption site, showing flows emplaced in 2002, with the exception of those active only through January (see December 2001–January 2002 monthly report).

SEISMIC INSTRUMENTATION

The network. The Hawaiian Volcano Observatory maintains an extensive telemetered seismic network on the Island of Hawai'i. The standard HVO field sensors, 1-Hz geophones, are deployed as single-component, vertical-only units or as three-component combinations of one vertical and two orthogonal horizontal units. The 2002 network consisted of 50 station sites: 9 three-component, 3 six-component (which included a three-component Kinemetric Force-Balance accelerometer), 2 four-component (Uwekahuna included a low-gain vertical with a unity gain setting; Ainapo included a moderate-gain vertical with a 48db setting), 3 two-component (each site included a moderate-gain vertical with a 48db setting), and 33 vertical-component-only sites. The coverage is most dense on and around Kilauea Volcano. During 1999 HVO added to the network three vertical-component-only sites on the Island of Maui. All seismic signals from the network are telemetered in real time to the Observatory for recording.

The Pacific Tsunami Warning Center (NOAA) operates and maintains a network of stations on the islands of Hawai'i, Maui, and O'ahu. In 1999, radio links were established to share data, in real-time, between PTWC and HVO. PTWC signals from one O'ahu three-component station, and one Maui and four Hawai'i vertical-component-only stations, were telemetered to the Observatory for recording.

Figure 1 is a map of selected geographic and geologic features. Figure 2 shows the sites of seismic stations operated by HVO and PTWC on the Island of Hawai'i during 2002. Figure 3 indicates the telemetry scheme for the seismic stations on Hawai'i Island, and figures 4a and 4b are expanded views of the telemetry schemes at Kilauea summit: 4a, HVO seismic stations and 4b, broadband network installed by Menlo Park and maintained by HVO. Figure 5 indicates the telemetry scheme for the seismic stations on Maui Island.

Table 1 lists seismic stations by names, four-letter station codes, coordinates in degrees and minutes (old Hawaiian datum), elevation in meters, and other data, as described below, pertaining to each station. The list includes all the stations operated by HVO during 2002. Seismic stations operated by PTWC on the Islands of Hawai'i, O'ahu and Maui are also listed. Phase times from PTWC stations, not telemetered to HVO, are used to supplement local earthquakes and earthquakes that occur within the Hawaiian Archipelago but distant from the Hawai'i Island network.

Instrumentation and recording. Each telemetered station's data channel has a voltage-controlled oscillator (VCO) for FM multiplex transmission to HVO via radio. These telemetering stations are all of Type 1, Earthquake Hazards Team (EHT) standard system used in USGS seismic networks (see table 2 for details). After discrimination at the receiver, the analog signals are converted to digital form as part of the routine computer location processing and archiving. Through July 2001, continuous signals from the telemetered network were saved on 4-mm digital-audio tape (DAT) recording units. Three DAT recorders ran in automatic rotation, as each ~20-hr tape was filled. Optic recordings are coded in table 1 as follows: H - Helicorder paper, and I - ink paper. DAT and paper records are archived at HVO.

Seismograph response and calibration. Response curve for the short-period seismograph type in use is given in figure 6. The Type 1 curve gives the magnification of the standard EHT system from ground motion at the seismometer to the seismic trace, as seen on a 20x Develocorder film viewer. The curve plots the unit response, which is multiplied by a constant but known factor, CAL, to get the response for an individual station. Individual CAL factors for Type 1 seismographs are Develocorder equivalent peak-to-peak amplitudes, measured in millimeters, of a 100-microvolt 5 to 8-Hz signal introduced to the preamp/VCO in place of the geophone at the field station. The calibration process is normally performed each time a station is visited for other required maintenance.

Table 2. Seismic instrument types

The codes in parentheses refer to the seismometer types listed in Table 1.

Type 1 (Codes E, L, R, and 4, 5) consists of:

a) Geophone - Electrotech EV-17 (E), Mark Products L4C (L) or Kinemetric Ranger SS1 (R). (L) and (R) are 1.0-sec. period moving-magnet vertical- or horizontal- (E-W and N-S) component seismometers adjusted for an output of 0.5 volts/cm/sec and 0.8, critically damped.

b) Preamp/VCO - USGS/OEVE Model J502, J512 (5) voltage-controlled oscillator. Three db points for bandpass filter at 0.1 Hz and 30 Hz. Signals are transmitted on audio FM carrier over cable or FM radio link to HVO.

Code (W) - Wood-Anderson torsion seismograph.

Code (MW) - Horizontal-component seismograph based on a Type 1 system and modified to 3x a Wood-Anderson response.

Code (F) - Kinemetric Force-Balance Accelerometer (FBA23).

Code (S13) – Geotech, 1Hz seismometer with A1 VCO operated by the Pacific Tsunami Warning Center.

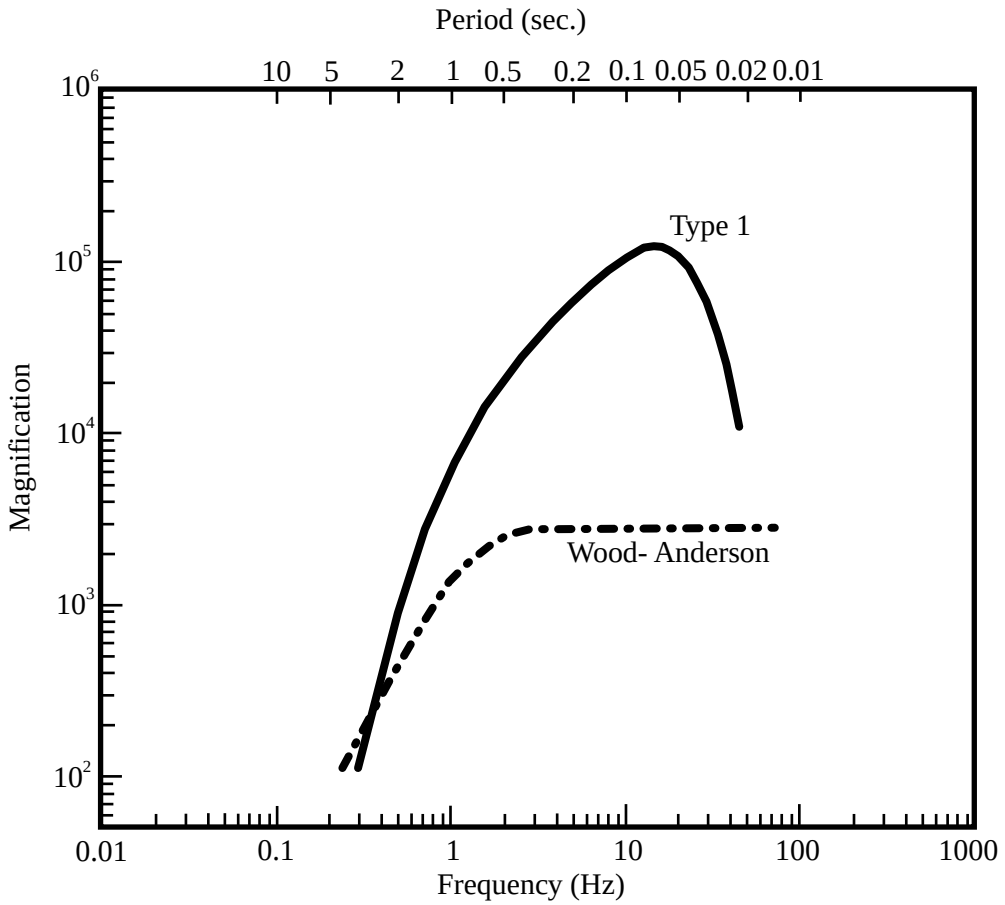

Figure 6. System-response curves for the Wood-Anderson torsion seismograph and for seismometers used by the Hawaiian Volcano Observatory. The Type 1 curve plots the unit response of the standard USGS microearthquake seismometer system recorded on Develocorder film. This includes the geophone, all electronics including telemetry, Develocorder galvanometer, and projection of film by a 20x viewer. The unit response curve is multiplied by constant but known factors (CAL) to obtain the responses for individual stations.

SEISMIC DATA PROCESSING

Due to age and high cost of maintanance, Develocorder 'A' was discontinued on August 1, 1997. Daily count of classified micoearthquakes from source regions around Kilauea and Mauna Loa, and duration of tremor, were also discontinued. Coda duration, however, is measured in seconds from drum (ink or helicorder) records to determine a coda magnitude that is entered as an external magnitude in the final solution.

In 1986, HVO acquired a VAX 11-750 computer and adopted the CUSP (California Institute of Technology USGS Seismic Processing) routine. Discriminated analog signals are converted to digital form, and detected events are saved in real time. Detected events are demultiplexed, and P-picks are made by the computer, producing a rough location. Events are examined by an analyst, on a graphics terminal, to refine computer P-picks and to time additional P- and S-phases for a preliminary location. Binary CUSP files are archived on magneto-optical media and translated into ASCII phase files. Locations and amplitude magnitudes are then determined, using the program HYPOINVERSE-2000 (Klein, 2002) [2]. Events are reworked and rerun, as needed, to produce a final solution. Magneto-optical copies of arrival times and output summary data are kept at HVO.

In July 1992, HVO acquired VAX workstations for timing earthquakes using a "generic" version of CUSP. In addition to timing P and S arrival signals, the VAX workstations are capable of measuring peak-to-peak amplitudes along with the associated period. This capability allowed the renewal of amplitude magnitude determinations from the network seismic stations. Amplitude data gathered from July 1992 to July 1997 became part of a test set to determine magnitude corrections for network stations. Results of newly determined magnitude corrections are detailed by Nakata and Okubo (1997) [3].

The crustal model used is specified by velocities at four depth points. Velocity at any depth is given by linear interpolation between points and uses a homogeneous half-space, as listed below:

VELOCITY (km/sec)	DEPTH (km)
1.9	0.0
6.5	4.6
6.9	15.0
8.3	≥16.5

Two empirical sets of station delays or corrections were used in the HYPOINVERSE locations and are given in table 1. The delay models are separated by a circle of radius 34 km, centered at 19°22' N and 155°10' W. Delay model 1 is used for epicenters occurring within a circle of radius 31 km from the center. This region includes Kilauea and its south flank. A combination of the two delay models is used for epicenters that fall in a transition zone that is 6 km wide. Delay model 2 is applied to the rest of the island and offshore earthquakes. For a detailed description, refer to Klein[2].

Magnitudes for events are computed using recorded amplitudes on selected network vertical, Modified Wood-Anderson (MW) horizontal, and/or moderate and low gain stations. Amplitude readings are corrected to an equivalent Wood-Anderson amplitude using the curves of figure 6 and CAL factors listed in table 1.

Duration magnitude is determined by the length of signal, in seconds, read from drum recordings of Type 1 seismographs. This length of time is measured from the P arrival to the point where the earthquake signal has decayed to nearly the background noise level. Drum-recorded duration magnitude is calculated with a relationship equivalent to the develocorder viewer output.

SEISMIC CATALOG

The emphasis in both station coverage and detailed data analysis is on the highly active south half of the Island of Hawai'i. The set of well-recorded earthquakes located in the Hawai'i Island region is nearly complete above magnitude 2.0. Many smaller events are located in the densely instrumented Kilauea area. Substantial effort is made to locate earthquakes elsewhere within the Hawaiian Archipelago. Such coverage cannot be as complete as in south Hawai'i, but nearly all events above magnitude 4.0 are located with limited precision.

Data presented in the seismic catalog are in three parts: (1) Maps showing computer-located hypocenters are given in figures 11-24. The location maps are of different scales and provide hypocenters with magnitude thresholds set at 1.0, 2.0, 3.0, and 3.5, varying according to region. (2) The list of computer locations constitutes the bulk of this summary and is given in table 4. Each earthquake in the list is assigned a three-letter code based on its general location and depth. Figures 7-10 are maps of the regions used to assign the location codes. The latitude and longitude limits of rectangular regions are listed in table 3. When the listed coordinates overlap, precedence is given according to figures 7-10. (3) Table 5 re-lists the events in table 4 for which the preferred magnitude is 3.0 or larger. This list includes many of the earthquakes felt in Hawai'i.

Table 3. Names and coordinates of regions used for classifying earthquakes.

All earthquakes locate in one of the following groups, identified by a numerical class or three-letter code:

—Shallow:
1 SNC - Shallow north caldera (0-5 km)
2 SSC - Shallow south caldera (0-5 km)
3 SEC - Shallow east caldera (0-5 km)
4 SER - Shallow east rift (0-5 km)
5 SME - Shallow middle east rift (0-5 km)
6 KOA - Koa'e fault zone (0-5 km)
7 SSF - Shallow south flank (0-5 km)
8 SLE - Shallow lower east rift (0-5 km)

—Intermediate depth:
9 SF1 - Kilauea south flank (5-13 km) (west end)
10 SF2 - Kilauea south flank (5-13 km)
11 SF3 - Kilauea south flank (5-13 km)
12 SF4 - Kilauea south flank (5-13 km)
13 SF5 - Kilauea south flank (5-13 km) (east end)
14 LER - Lower east rift (5-99 km)
15 MLO - Mauna Loa (0-13 km)
16 LSW - Lower southwest rift zones of Kilauea and Mauna Loa (0-13 km)
17 GLN - Glenwood (0-13 km)
18 SWR - Southwest rift zone of Kilauea (0-13 km)
19 INT - Intermediate caldera (5-13 km)
20 KAO - Ka'oiki (0-13 km)

—Deep:
21 DEP - Deep Kilauea (>13 km) (below regions 1-13, 17-19)
22 DLS - Deep lower southwest rift zone of Kilauea and Mauna Loa (>13 km) (below region 16)
23 DML - Deep Mauna Loa (>13 km) (below regions 15, 20)

—Outer regions, all depths:
24 LOI - Lo'ihi
25 KON - South Kona
26 HUA - Hualalai
27 KOH - Kohala
28 KEA - Mauna Kea
29 HIL - Hilo
30 DIS - Distant, everywhere else

Table 3 (continued). The latitude and longitude limits of the regions are given below. If the coordinates overlap, precedence is given according to maps in figures 7-10.

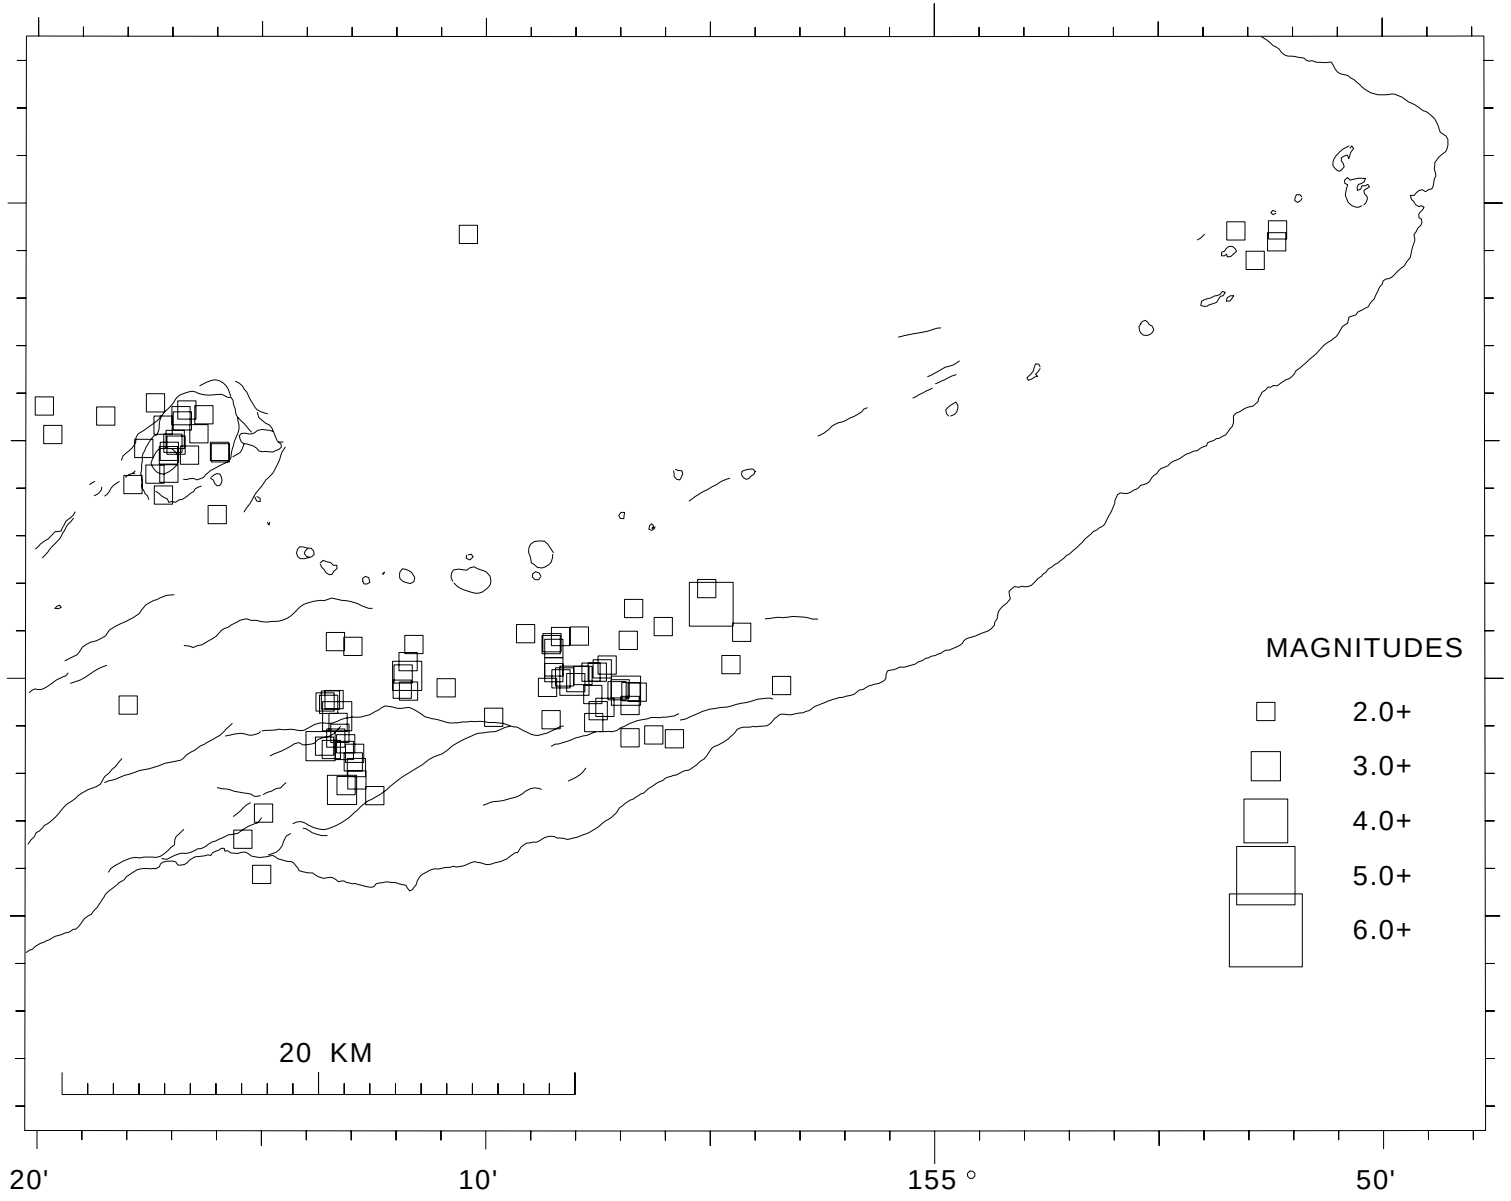

Figure 21. 2002 earthquake locations, Kilauea south flank, deep (13.1±60.0 km depth), M>=2.0.

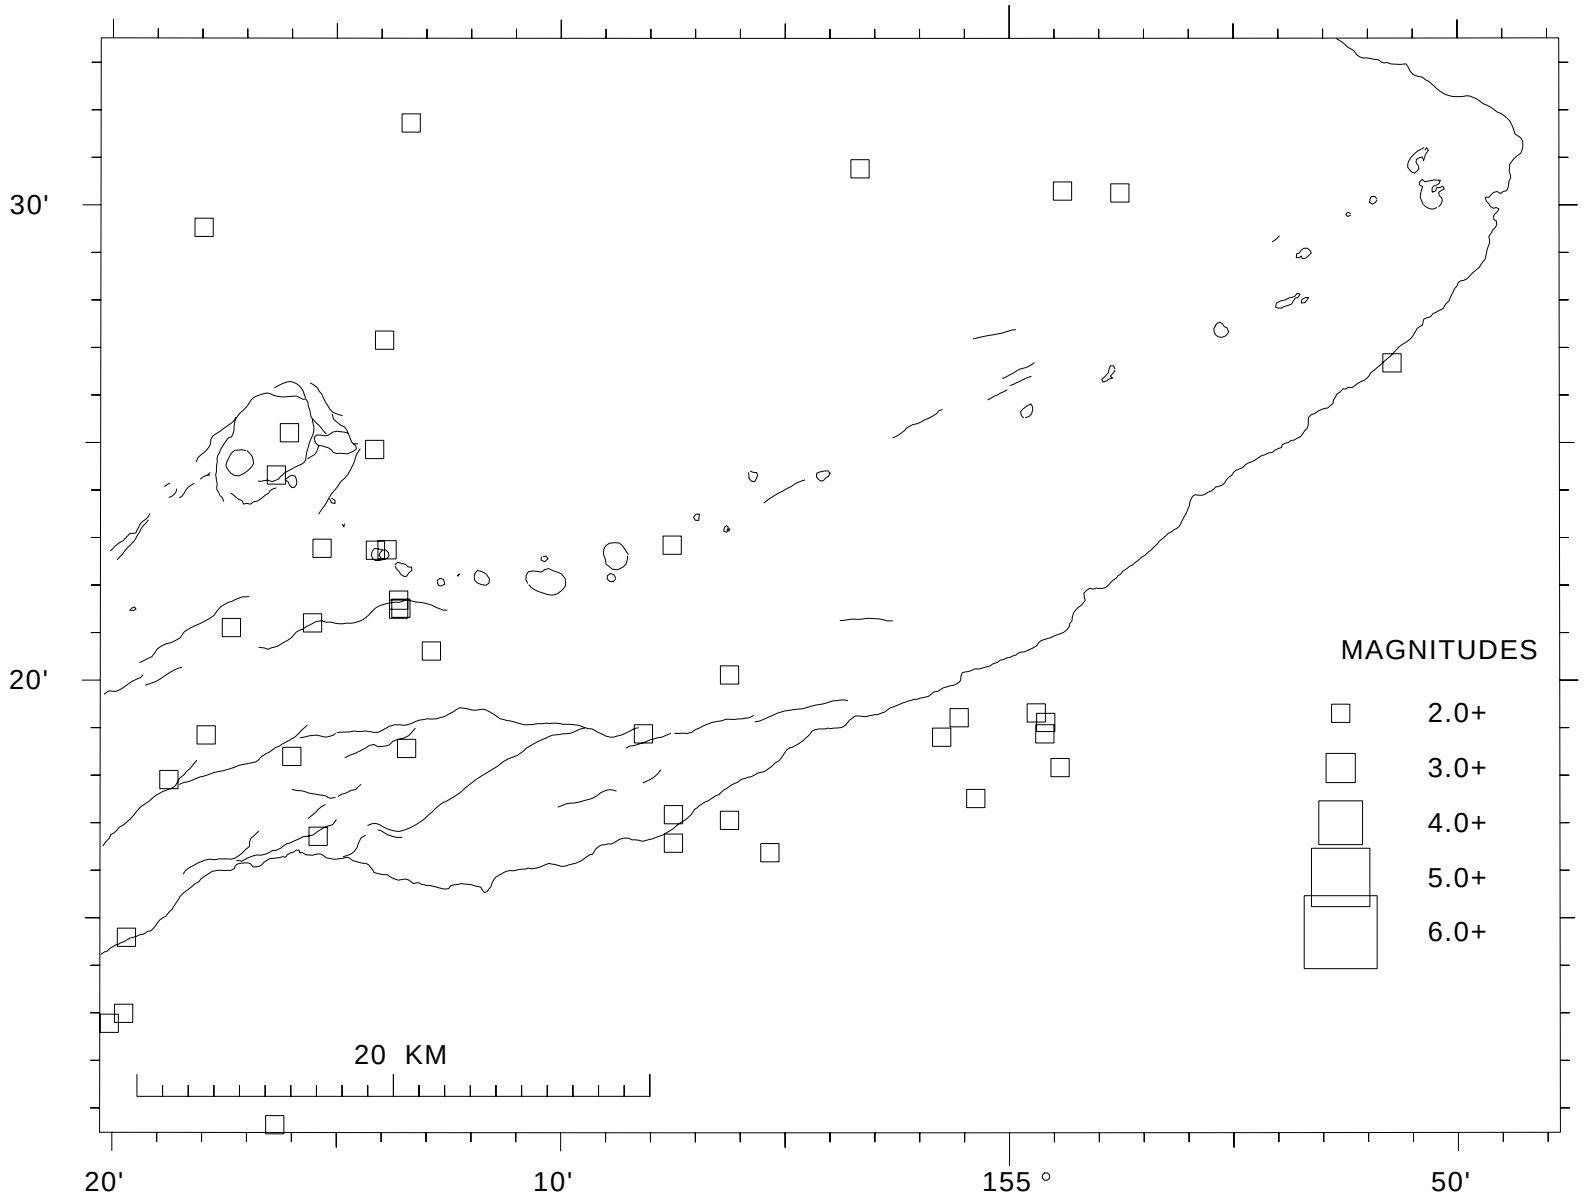

Figure 22. 2002 earthquake locations, Mauna Loa summit, shallow (0±5.0 km depth), M>=2.0.

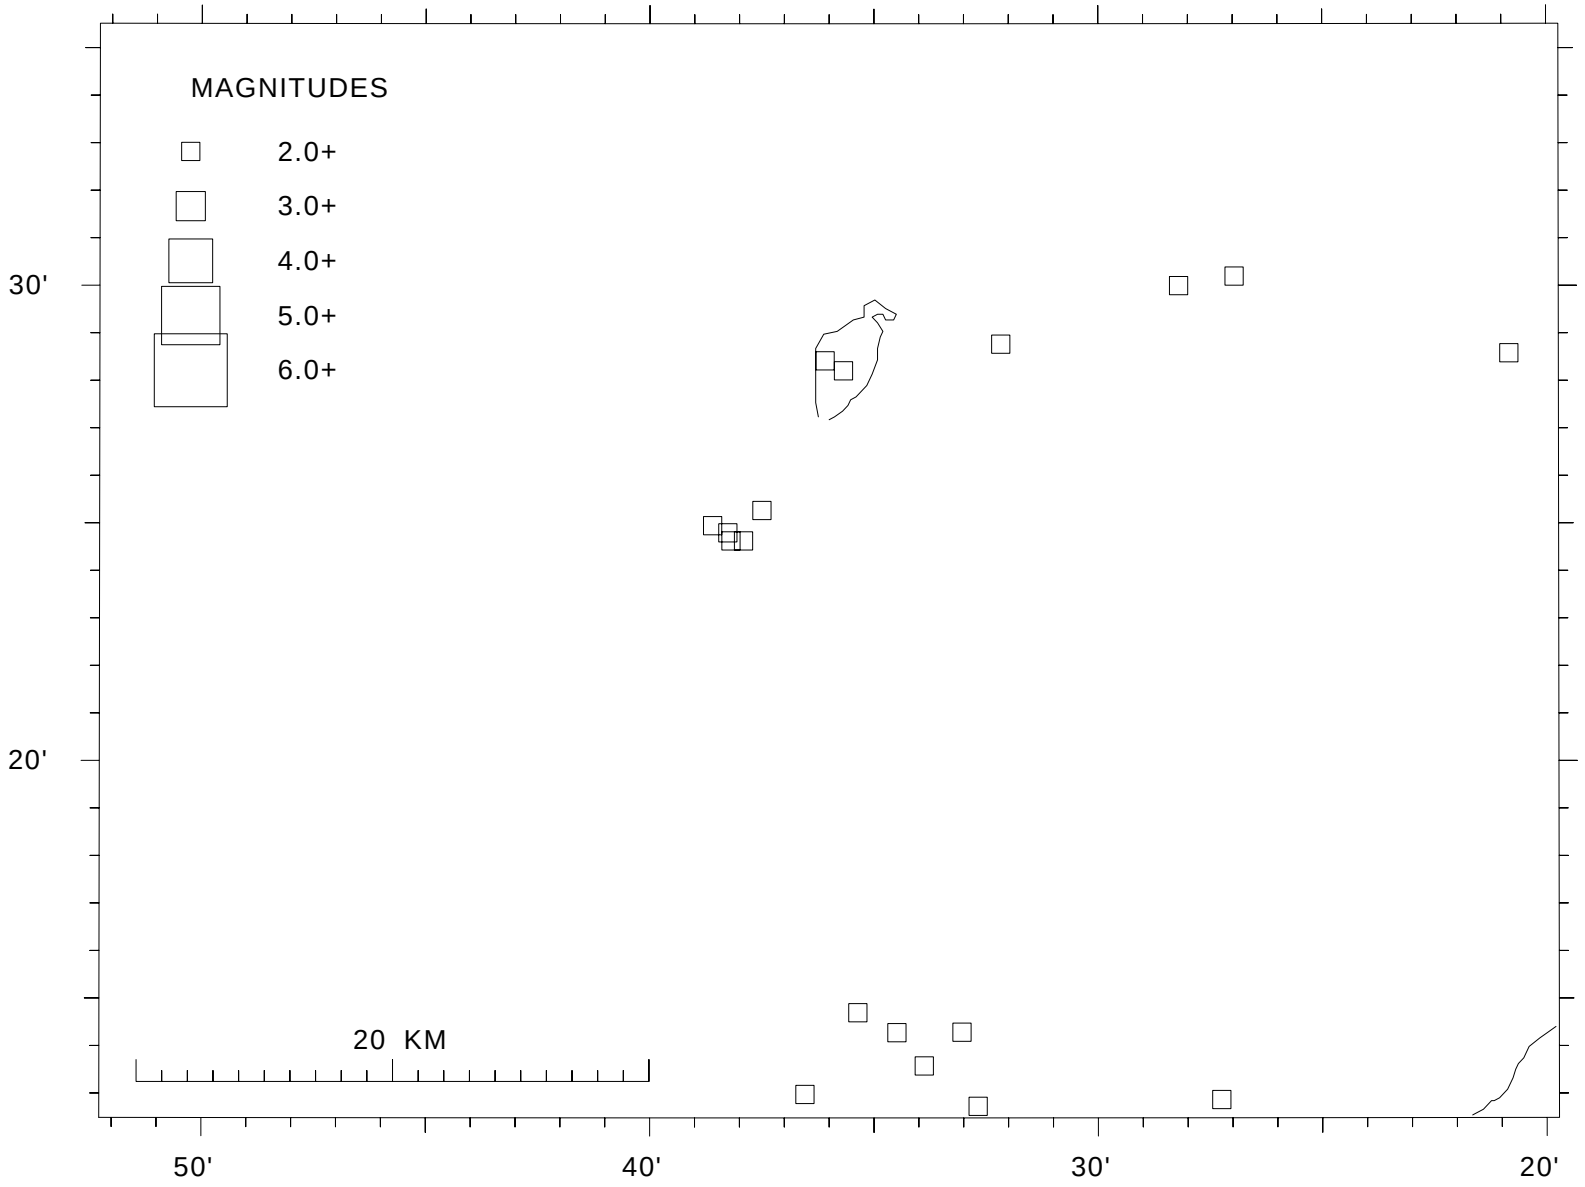

Figure 23. 2002 earthquake locations, Mauna Loa summit, intermediate (5.1±13.0 km depth), M>=2.0.

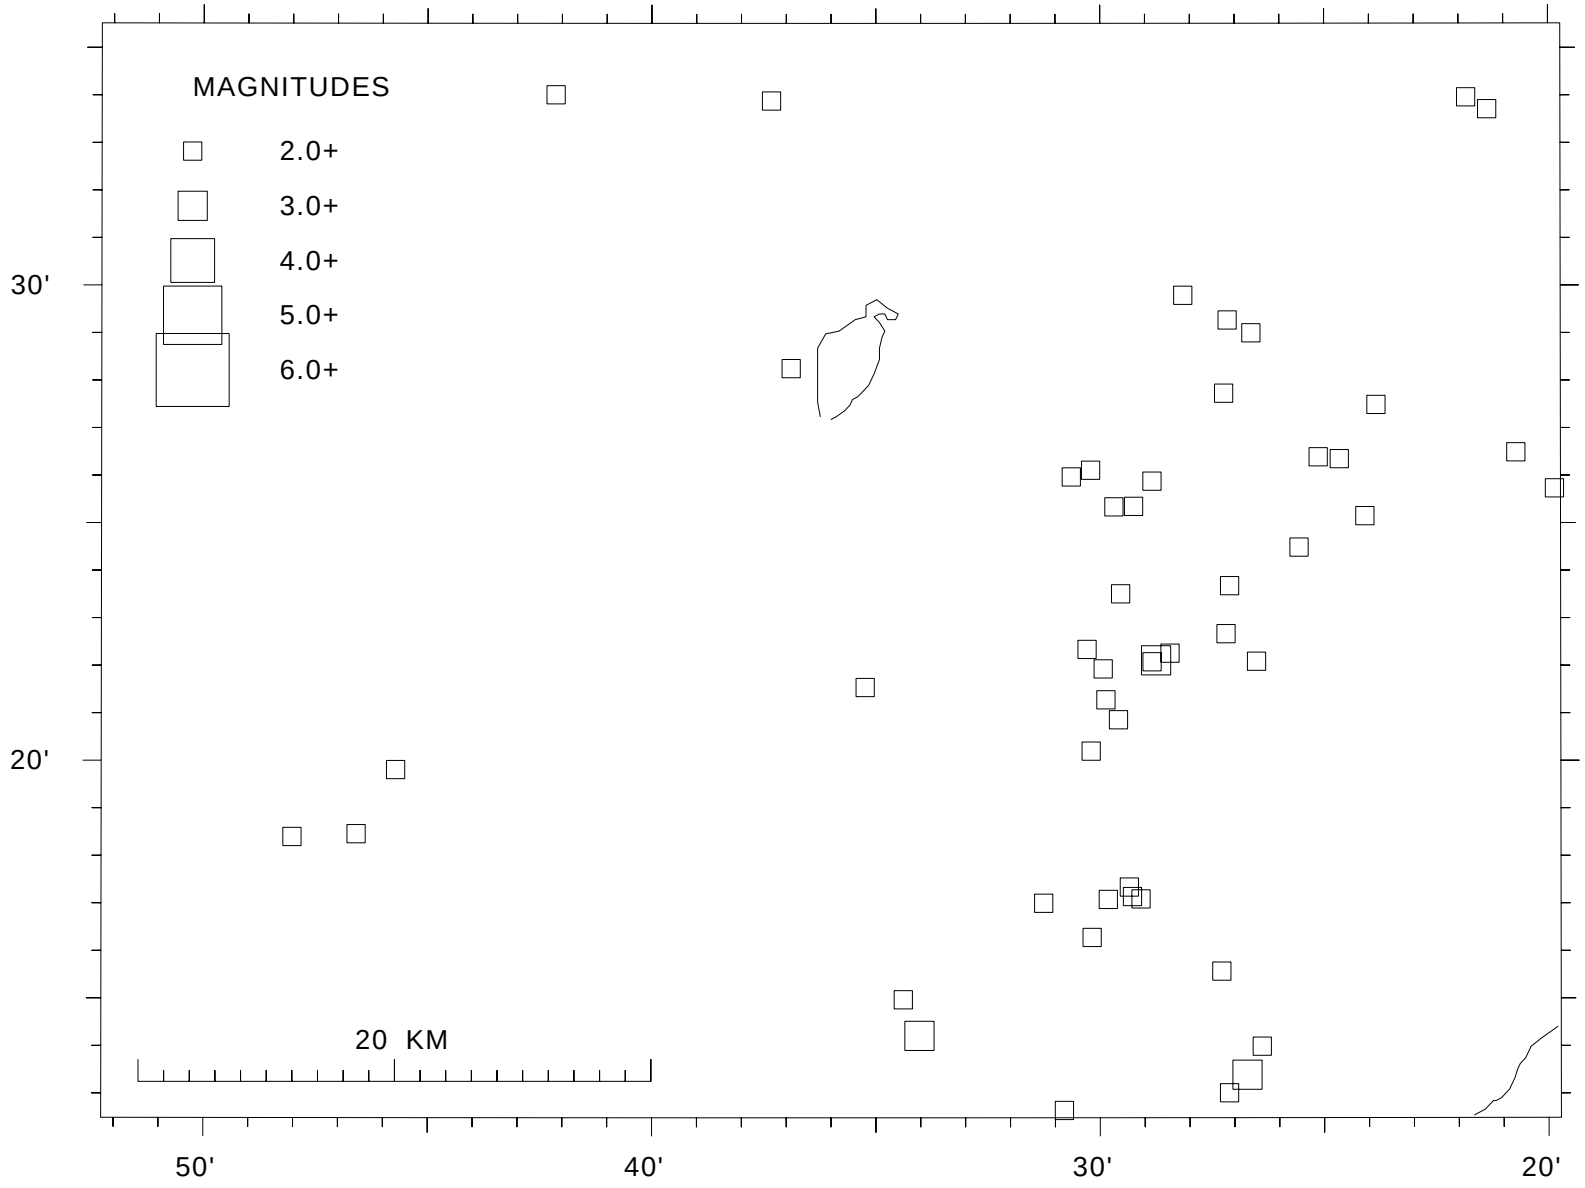

Figure 24. 2002 earthquake locations, Mauna Loa summit, deep (13.1±60.0 km depth), M>=2.0.

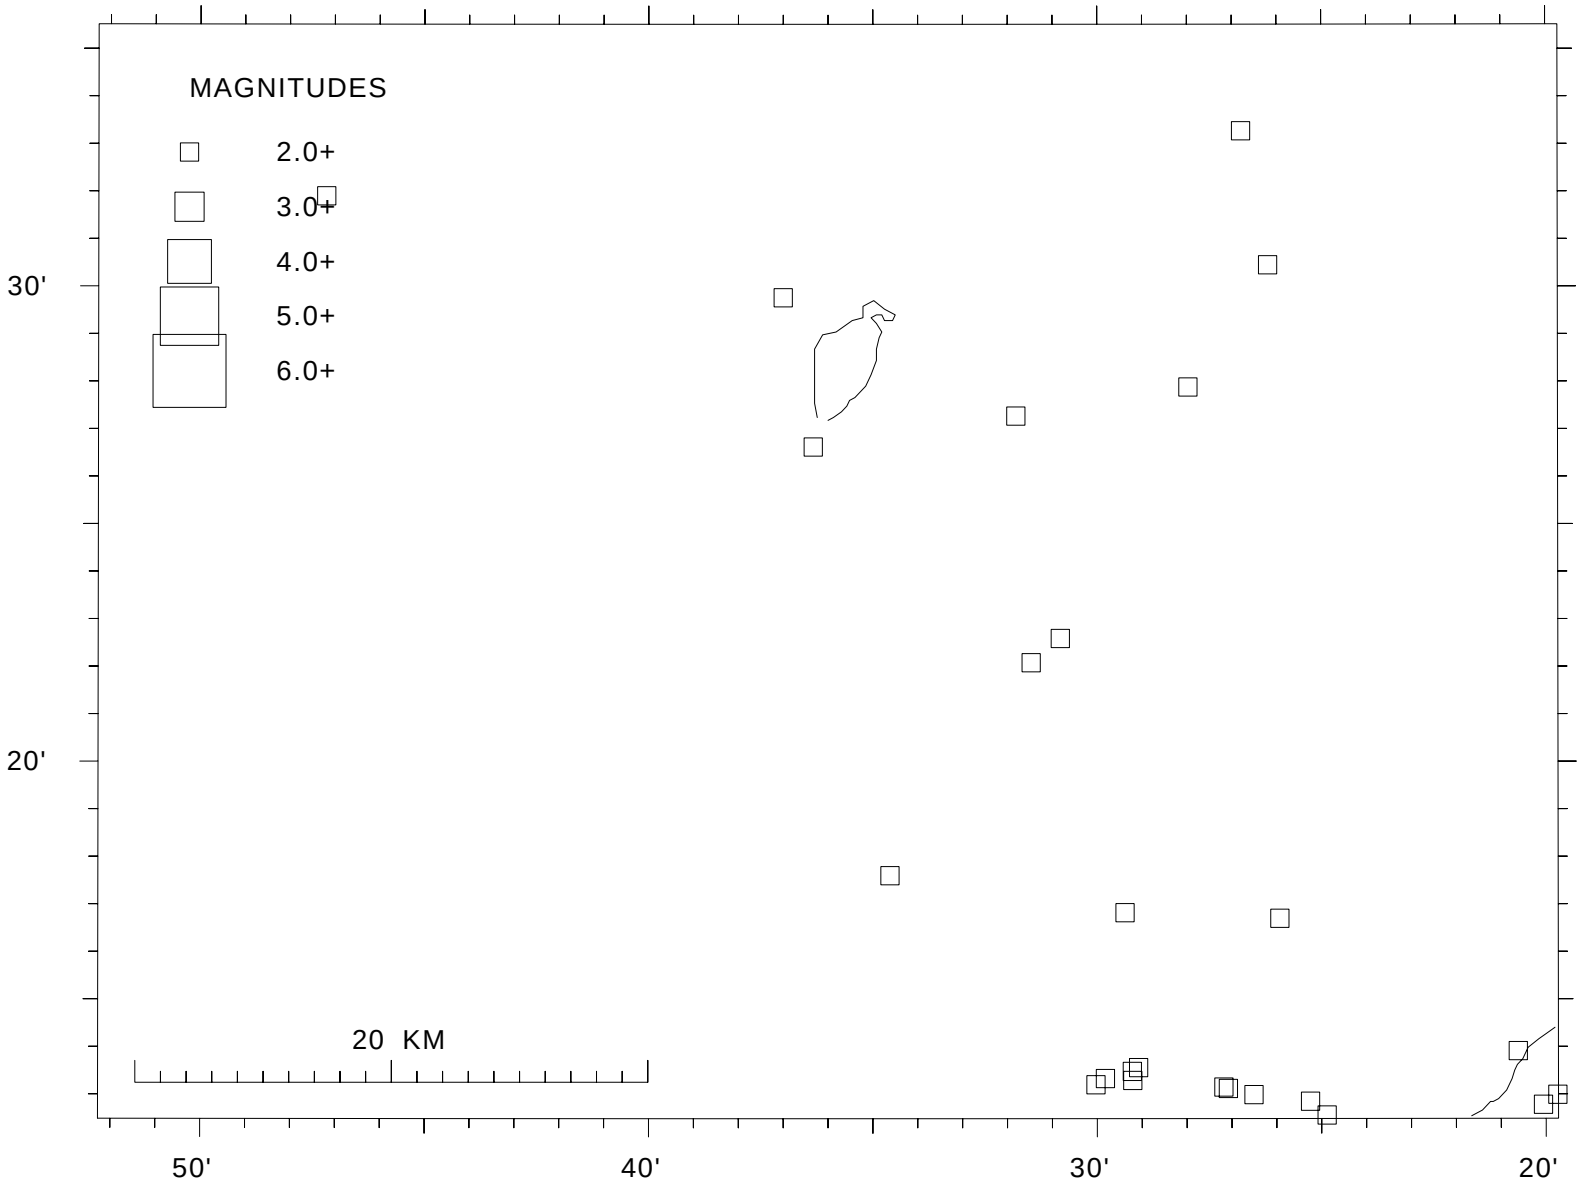

Table 4 is a chronological list of selected events successfully located during 2002. For each event, the following data are presented:

ORIGIN TIME - in Hawaiian Standard Time: date, hour (HR), minute (MN), and second (SEC).

EPICENTER - in degrees and minutes of north latitude (LAT N) and west longitude (LON W) in Old Hawaiian Datum.

DEPTH - Depth of focus in kilometers.

NRD - Number of P & S readings with final weights > 0.1.

NS - Number of S readings with final weights > 0.1

RMS SEC - Root mean square travel time residuals, in seconds.

ERH km - Standard error of the epicenter, in kilometers.

ERZ km - Standard error of depth of focus, in kilometers.

LOC REMKS - Remarks, three-letter code for geographic location of events. See Figures 7-10 for location of mnemonic code. Additional one-letter codes have the following meanings:

F felt

L long-period character

T associated with harmonic tremor

B quarry or other blast

the location program had a convergence problem, which usually means that the depth may be unreliable.

- the depth was held fixed.

PREF MAG – The preferred magnitude chosen from the available magnitudes.
Preference set as: X-amplitude magnitude, if none
D-Develocorder duration magnitude, if none
U-external magnitude, usually calculated from drum records.

AZ GAP - Largest azimuthal gap in degrees between azimuthally adjacent stations.

MIN DS – Distance to the nearest station, in kilometers.
