

Figure 9. Concentration of E. Coli plotted as lines parallel with the shore. The top panel shows the distribution of coliforms on the beach during the four hours of this sampling cycle. The vertical axis in this panel is time and the horizontal axis is distance alongshore relative to the Santa Ana River. The remaining panels show the concentration of E. Coli in the water column offshore from the beach. In these panels the vertical axis is depth and the horizontal axis is the same as in the top panel.
