

**Figure 3-30.** The ratio of enterococci concentrations to the AB411 single-sample standard at stations 15S to 21N for the third intensive sampling period is plotted together with sampling times at station 0 (pink dots), Los Angeles sea level (red line), and temperature 0.5 m above bottom at HB01 (blue line). Only samples exceeding 104 MPN/100 mL are shown here. A local time reference is used. Note the change in vertical scale for the bacterial concentration ratio.
