

Figure 3-32. The ratio of total and fecal coliform concentrations to their respective AB411 single-sample standards* at stations 15S to 21N for the second intensive sampling period is plotted together with sampling times at station 0 (pink dots), Los Angeles sea level (red line), and temperature 0.5 m above bottom at HB01 (blue line). Only samples with ratios exceeding 0.5 are shown here. A local time reference is used.

*Note that not all samples with total coliform >1000 MPN/100 mL exceed AB411 standards, as the total/fecal coliform ratio may not be <10.
