

Marine Proxies for Antarctic Ice Volume: Continental Shelf Sequence Stratigraphy and Seismic Stratigraphy and Deep-Sea Records from High and Low Latitudes

A workshop organized by

Stephen F. Pekar,
Phillip J. Bart,
&
Christopher Fielding

Held at
The 10th International Symposium on
Antarctic Earth Sciences
University of California, Santa Barbara
August 26, 2007

3X2 50-80 c37X3 36-56 cm

**Table of Contents for:
Marine Proxies for Antarctic Ice Volume: Continental Shelf Sequence and
Seismic Stratigraphy and $\delta^{18}\text{O}$ Records from High and Low Latitudes**

Workshop Schedule 3

Purpose of this Workshop 4

Low-Latitude Stratigraphic Records

*Estimating Eustasy and Ice Volume from Backstripped
Low-Latitude Stratigraphy* MWR02A

By Michelle Kominz and Stephen Pekar

High-Latitude Sedimentology and Stratigraphy

*Stratigraphy of the Western Victoria Land Basin: A New Perspective
Based on Integration of Cores with Seismic Reflection Data* No report

By Christopher R. Fielding, Stuart A. Henrys and Terry J. Wilson

*Glacial Extent from Lithofacies Distribution and Terrigenous
Supply in Cores from the Antarctic Margin* No report

By Sandra Passchier

High Latitude Seismic Stratigraphy

Antarctic Seismic Stratigraphy MWR02B

By Phillip Bart and Laura De Santis

Estimating Ice Volume from Deep-Sea Records

Estimating Cenozoic Ice Volume from Deep-Sea Records MWR02C

By Stephen Pekar and Caroline Lear

Schedule for Marine Proxies for Antarctic Ice Volume: Continental Shelf Sequence and Seismic Stratigraphy and $\delta^{18}\text{O}$ Records from High and Low Latitudes

Location of Workshop: UCEN Flying A

12:30- 12:45	Welcome, Introduction, Objectives of Workshop	
12:45- 1:30	High-latitude sedimentology and stratigraphy Presentations by Christopher Fielding, Sandra Passchier, & Ross Powell	
1:30 – 1:55	Discussion	
1:55 - 2:40	High-latitude seismic stratigraphy Presentation by Phil Bart and Laura De Santis	
2:40 -3:05	Discussion	
3:05 - 3:15	Coffee Break	
3:15 - 4:00	Low-latitude stratigraphy and backstripping Presentations by Michelle Kominz, Stephen Pekar, & Timothy Naish	
4:00 - 4:25	Discussion	
4:25 - 5:05	Deep-sea evidence: Mg/Ca ratios and $\delta^{18}\text{O}$ records Presentation by Stephen Pekar	
5:05 - 5:30	Discussion	
5:30 - 6:00	Beer and wine reception	Manzanita Village
6:00 - 8:00	Dinner buffet	Manzanita Village
7:30 - 8:30	Wrap up meeting, further discussions, book plans	De Anza 1018

Marine Proxies for Antarctic Ice Volume: Continental Shelf Sequence Stratigraphy and Seismic Stratigraphy and $\delta^{18}\text{O}$ Records from High and Low Latitudes

Co-organizers

Stephen Pekar

Queens College, City University of New York and
Lamont-Doherty Earth Observatory of Columbia University

Phillup J. Bart,

Louisiana State University

Christopher Fielding,

University of Nebraska at Lincoln

PURPOSE OF THIS WORKSHOP

This is a short workshop on bringing together a critical mass of researchers to describe, instruct, share, and discuss some of most important methods in deciphering the cryospheric evolution in Antarctica during the Cenozoic. This includes methods using records from distal sources such as isotopic records from deep-sea cores and stratigraphic records from continental margins, which although are relatively complete, typically include signals not directly related to changes in the ice sheet. Proximal records on the other hand, such as borehole and seismic data from around Antarctica, provide the most direct if inherently fragmentary and qualitative constraints on polar climate and ice sheet dimensions.

This workshop will provide an overview on how ice volume changes are constrained from a number of methods from both distal records and proximal records. It will also serve as a practical guide for understanding the methods as well. Several examples will be shown that will emphasize how the methods were implemented as well as how they can be applied in new data sets.

The workshop will include a series of powerpoint lectures, followed by Q&A and discussions on implementation on other data sets as well the problems, complexities, limitations of each data set in telling us about Antarctica. These will form the basis of discussions that will take stock of the strengths, uncertainties, and limitations of each of method, some of their cutting edge applications as well as comparing the similarities and differences among the different records. This will lead into developing a synthesis of what critical data are needed from the next phase of scientific investigations.
