This map is not intended for survey purposes.

Project Description
The National Park Service (NPS) contracted with the National Aeronautics and Space Administration (NASA) Wallops Flight Facility to create a high-resolution, first-surface topography map of Colonial National Historical Park, VA. The data were acquired with the NASA Experimental Airborne Laser (EAARL) system during April 2005. The data were processed at the USGS Florida Integrated Science Center (FISC) in St. Petersburg, FL. The map is the result of a partnership between the National Park Service (NPS), the Coastal and Marine Geology Program (CMGP) of the USGS-NPS-NASA Project, and the U.S. Department of the Interior (USGS-NPS-USGS-NASA Project). This product is the result of ongoing research projects to improve coastal land and marine management and disaster response capabilities, and to more fully understand the value of coastal areas to the nation.

The lidar data were collected by a National Aeronautics and Space Administration End-to-End Team consisting of ETI Professionals, contracted to USGS, St. Petersburg, FL. The lidar data were processed by the USGS FISC office, St. Petersburg, FL. The lidar data were made available to the public as瓦尔多夫 336000e_4120000n map tiles.
