EXPLANATION  
 ——— 4 ———  
 ——— 2 ———  
 ——— 0 ———  
 ISOPACH CONTOURS  
 (dashed where inferred)  
 CONTOUR INTERVAL, 2 METERS

Thicknesses are based on an assumed compressional-wave velocity of 1500 m/s.

Areas shown within the zero contours denote bedrock, coastal plain strata, and (or) glacial drift where inferred from the seismic profiles to crop out through the postglacial deposits. Locally, these areas may be blanketed by a thin mantle of recent sediment unresolvable in the seismic-reflection records.
