

CD3144 – Heedan wellfield

CD3144 “HEEDAN NO 13” in the Heedan wellfield in the Wadi Wala basin has an upward trend of $+7.9 \mu\text{S}/\text{cm}/\text{yr}$. However, the R^2 is quite low, 0.06, and the data since the mid-2000’s suggests a recent downward trend. This may reflect recharge of lower salinity floodwaters by the Wadi Wala dam.
