

## H 2016 – Hammad basin

Well H 2016 “WADI GHUSAIN” is a monitoring well where water levels have risen.

The current rate of rise is about +0.19 m/yr, which is less steep than the long-term average rise of +0.41 m/yr since 1994. The saturated thickness of the B4 aquifer at this well has increased since 1994. The long-term rise in water levels may be related to increased recharge from rain harvesting or irrigation excess.
