

## IRON AND STEEL SLAG

(Data in million metric tons unless otherwise noted)

**Domestic Production and Use:** Iron and steel (ferrous) slags are formed by the combination of slagging agents and impurities during the production of crude (or pig) iron and crude steel. The slags are tapped separately from the metals, cooled and processed, and are primarily used in the construction industry. Data are unavailable on actual U.S. ferrous slag production, but domestic slag sales<sup>1</sup> in 2019 were estimated to be 17 million tons valued at about \$470 million. Blast furnace slag was about 50% of the tonnage sold and accounted for 88% of the total value of slag, most of which was granulated. Steel slag produced from basic oxygen and electric arc furnaces accounted for the remainder of sales. Slag was processed by 28 companies servicing active iron and steel facilities or reprocessing old slag piles at about 129 processing plants (including some iron and steel plants with more than one slag-processing facility) in 33 States, including facilities that import and grind unground slag to sell as ground granulated blast furnace slag (GGBFS).

Air-cooled iron slag and steel slag are used primarily as aggregates in concrete (air-cooled iron slag only); asphaltic paving, fill, and road bases; both slag types also can be used as a feed for cement kilns. Almost all GGBFS is used as a partial substitute for portland cement in concrete mixes or in blended cements. Pelletized slag is generally used for lightweight aggregate but can be ground into material similar to GGBFS. Actual prices per ton ranged in 2019 from a few cents for some steel slags at a few locations to about \$120 or more for some GGBFS. Owing to low unit values, most slag types can be shipped only short distances by truck, but rail and waterborne transportation allow for greater travel distances. Because much higher unit values make it economic to ship GGBFS longer distances, much of the GGBFS consumed in the United States is imported.

<b>Salient Statistics—United States:</b>	<b>2015</b>	<b>2016</b>	<b>2017</b>	<b>2018</b>	<b>2019<sup>e</sup></b>
Production (sales) <sup>1, 2</sup>	17.7	15.7	16.2	16.8	17.0
Imports for consumption <sup>3</sup>	1.5	2.0	2.1	2.2	2.3
Exports	(4)	(4)	(4)	(4)	(4)
Consumption, apparent <sup>5</sup>	17.7	15.7	16.2	16.8	17.0
Price, average value, dollars per ton, f.o.b. plant <sup>6</sup>	19.50	22.00	24.50	26.50	27.50
Employment, number <sup>e</sup>	1,700	1,600	1,500	1,500	1,600
Net import reliance <sup>7</sup> as a percentage of apparent consumption	8	13	13	13	14

**Recycling:** Following removal of entrained metal, slag can be returned to the blast and steel furnaces as ferrous and flux feed, but data on these returns are incomplete. Entrained metal, particularly in steel slag, is routinely recovered during slag processing for return to the furnaces and is an important revenue source for slag processors; data on metal returns are unavailable.

**Import Sources (2015–18):** Japan, 24%; Canada, 20%; Brazil, 12%; Italy, 12%; and other, 32%.

<b>Tariff: Item</b>	<b>Number</b>	<b>Normal Trade Relations 12–31–19</b>
Granulated slag	2618.00.0000	Free.
Slag, dross, scale, from manufacture of iron and steel	2619.00.0000	Free.

## IRON AND STEEL SLAG

**Depletion Allowance:** Not applicable.

**Government Stockpile:** None.

**Events, Trends, and Issues:** In 2019, two blast furnaces were idled in the United States after two different blast furnaces were restarted in 2018. This continued the trend of U.S. blast furnaces being closed or idled in recent years (including four in 2015) and contributed to the reduction in the domestic supply of new blast furnace slag. However, many sites have large slag stockpiles, which can allow for processing to continue for several years after the furnaces are closed or idled. The majority of U.S. steel slag production is from electric arc furnaces.

At yearend 2019, domestic GGBFS remained in limited supply because granulation cooling was available at only two active U.S. blast furnaces. It remained unclear if new granulation cooling installations at additional blast furnace sites would be economic. Another plant produced a limited supply of pelletized slag, but it was uncertain if additional pelletizing capacity would be added. Grinding of granulated blast furnace slag was only done domestically by cement companies. Supply constraints appear to have limited domestic consumption of GGBFS in recent years. Although prices have increased, sales of GGBFS have not correlated with the increases in the quantity of cement sold since 2010.

The domestic supply of fly ash, which is used as an additive in concrete production, has decreased, owing to new restrictions of mercury and carbon dioxide (CO<sub>2</sub>) emissions at coal-fired powerplants, powerplant closures, and conversion of powerplants to natural gas. Mercury emission restrictions on cement plants, enacted in 2015, may reduce the demand for fly ash as a raw material in clinker manufacture, and air-cooled and steel slags could be used as substitute raw materials. Demand for GGBFS is likely to increase because its use in cement yields a superior product in many applications and reduces the unit CO<sub>2</sub> emissions in the production of the cement.

**World Mine Production and Reserves:** Because slag is not mined, the concept of reserves does not apply. World production data for slag were unavailable, but may be estimated as 25% to 30% of crude (pig) iron production and steel furnace slag as 10% to 15% of crude steel production. In 2019, world iron slag production was estimated to be between 320 million to 384 million tons, with steel slag production estimated to be between 190 million to 280 million tons.

**World Resources:** Not applicable.

**Substitutes:** In the construction sector, ferrous slags compete with natural aggregates (crushed stone and sand and gravel) but are far less widely available than the natural materials. As a cementitious additive in blended cements and concrete, GGBFS mainly competes with fly ash, metakaolin, and volcanic ash pozzolans. In this respect, GGBFS reduces the amount of portland cement per ton of concrete, thus allowing more concrete to be made per ton of portland cement. Slags (especially steel slag) can be used as a partial substitute for limestone and some other natural raw materials for clinker (cement) manufacture and compete in this use with fly ash and bottom ash. Some other metallurgical slags, such as copper slag, can compete with ferrous slags in some specialty markets, such as a ferrous feed in clinker manufacture, but are generally in much more restricted supply than ferrous slags.

<sup>0</sup>Estimated.

<sup>1</sup>Processed slag sold during the year, excluding entrained metal.

<sup>2</sup>Data include sales of imported granulated blast furnace slag and exclude sales of pelletized slag.

<sup>3</sup>U.S. Census Bureau data adjusted by the U.S. Geological Survey to remove nonslag materials (such as cenospheres, fly ash, and silica fume) and slags or other residues of other metallurgical industries (especially copper slag), whose unit values are outside the range expected for granulated slag. In some years, tonnages may be underreported.

<sup>4</sup>Less than 0.05 million tons.

<sup>5</sup>Defined as total sales of slag – exports.

<sup>6</sup>Rounded to the nearest \$0.50 per ton.

<sup>7</sup>Defined as imports – exports.
