## TALC AND PYROPHYLLITE<sup>1</sup>

(Data in thousand metric tons unless otherwise noted)

Domestic Production and Use: Three companies operated five talc-producing mines in three States during 2019, and domestic production of crude talc was estimated to have decreased by 3% to 630,000 tons valued at almost \$24 million. Montana was the leading producer State, followed by Texas and Vermont. Total sales (domestic and export) of talc by U.S. producers were estimated to be 570,000 tons valued at \$120 million, a slight increase from those in 2018. Talc produced and sold in the United States was used in paint (23%), ceramics (including automotive catalytic converters) (20%), paper (15%), plastics (12%), rubber (4%), roofing (3%), and cosmetics (2%). The remaining 21% was for export, insecticides, refractories, and other miscellaneous uses.

One company in North Carolina mined and processed pyrophyllite in 2019. Domestic production was withheld in order to avoid disclosing company proprietary data and was estimated to have decreased from that in 2018. Pyrophyllite was sold for refractory, paint, and ceramic products.

| apparent consumption  | 22          | 27          | 20          | 7           | 11                |

**Recycling:** Insignificant.

<u>Import Sources (2015–18)</u>: Pakistan, 41%; Canada, 27%; China, 21%; and other, 11%. Large quantities of crude talc are thought to have been mined in Afghanistan before being milled in and exported from Pakistan.

| Tariff: Item                                | Number       | Normal Trade Relations<br>12–31–19 |
|---|--------------|------------------------------------|
| Natural steatite and talc:                  |              |                                    |
| Not crushed, not powdered                   | 2526.10.0000 | Free.                              |
| Crushed or powdered                         | 2526.20.0000 | Free.                              |
| Talc, steatite, and soapstone; cut or sawed | 6815.99.2000 | Free.                              |

<u>Depletion Allowance</u>: Block steatite talc: 22% (Domestic), 14% (Foreign). Other talc and pyrophyllite: 14% (Domestic and foreign).

Government Stockpile: None.

## **TALC AND PYROPHYLLITE**

Events, Trends, and Issues: Canada, China, and Pakistan were the principal sources for United States talc imports in recent years. Imports from Pakistan increased significantly in recent years and imports from China dropped to about one-third of previous levels. In 2019, imports from China stayed near 2018 levels and imports from Pakistan increased by about 16% compared to those of the previous year. Canada and Mexico continued to be the primary destinations for United States talc exports, collectively receiving about one-half of exports. U.S. talc production decreased in 2019 from that of 2018 but was still the second-highest level of production during the past 5 years. Apparent consumption was relatively flat for 4 consecutive years through 2017 but decreased in 2018 before increasing in 2019.

Ceramic tile and sanitaryware formulations and the technology for firing ceramic tile changed over recent decades, reducing the amount of talc required for the manufacture of some ceramic products. For paint, the industry shifted its focus to production of water-based paint (a product for which talc is not well suited because it is hydrophobic) from oil-based paint, in order to reduce volatile emissions. Paper manufacturing began to decrease beginning in the 1990s, and some talc used for pitch control was replaced by chemical agents. For cosmetics, manufacturers of body dusting powders shifted some of their production from talc-based to corn-starch-based products. The paper industry has traditionally been the largest consumer of talc worldwide; however, plastics are expected to overtake paper as the predominant end use within the next several years, as papermakers in Asia make greater use of talc substitutes and as the use of talc in automobile plastics increases.

<u>World Mine Production and Reserves</u>: Reserves for Brazil, India, and the Republic of Korea were revised based on Government and industry sources.

| World total (rounded) <sup>7</sup>            | 6,600       | 6,600                 | Large        |

<u>World Resources</u>: The United States is self-sufficient in most grades of talc and related minerals, but lower priced imports have replaced domestic minerals for some uses. Talc occurs in the United States from New England to Alabama in the Appalachian Mountains and the Piedmont region, as well as in California, Montana, Nevada, Texas, and Washington. Domestic and world identified resources are estimated to be approximately five times the quantity of reserves.

<u>Substitutes</u>: Substitutes for talc include bentonite, chlorite, feldspar, kaolin, and pyrophyllite in ceramics; chlorite, kaolin, and mica in paint; calcium carbonate and kaolin in paper; bentonite, kaolin, mica, and wollastonite in plastics; and kaolin and mica in rubber.

eEstimated. NA Not available.

<sup>&</sup>lt;sup>1</sup>All statistics exclude pyrophyllite unless otherwise noted.

<sup>&</sup>lt;sup>2</sup>Defined as sold by producers + imports – exports.

<sup>&</sup>lt;sup>3</sup>Average ex-works unit value of milled talc sold by U.S. producers, based on data reported by companies.

<sup>&</sup>lt;sup>4</sup>Includes only companies that mine talc or pyrophyllite. Excludes office workers and mills that process imported or domestically purchased material.

<sup>&</sup>lt;sup>5</sup>Defined as imports – exports.

<sup>&</sup>lt;sup>6</sup>See Appendix C for resource and reserve definitions and information concerning data sources.

<sup>&</sup>lt;sup>7</sup>Includes pyrophyllite.
