ALUMINUM ${ }^{1}$
(Data in thousand metric tons unless otherwise specified)
Domestic Production and Use: In 2023, three companies operated five primary aluminum smelters across five States. Two of these smelters operated at full capacity throughout the year, whereas three smelters operated at reduced capacity. A sixth smelter, located in Hawesville, KY, has been temporarily shut down since 2022. In March, permanent closure was announced for a seventh smelter located in Ferndale, WA, that had ceased operations in 2020. Domestic smelter capacity decreased to 1.36 million tons per year from 1.64 million tons per year in 2022. Estimated primary production decreased by $13 \%$ from that in 2022, whereas estimated secondary production from new and old scrap was essentially unchanged from that in 2022. Based on published prices, the value of primary aluminum production was about $\$ 2.15$ billion, $26 \%$ less than that in 2022. The estimated average annual U.S. market price decreased by $15 \%$ from that in 2022. Transportation applications accounted for $35 \%$ of domestic consumption; the remainder was used in packaging, 22\%; building, 14\%; electrical, $9 \%$; consumer durables and machinery, $8 \%$ each; and other, 4\%.

Recycling: In 2023, aluminum recovered from purchased scrap in the United States was about 3.3 million tons, of which about 55\% came from new (manufacturing) scrap and $45 \%$ from old scrap (discarded aluminum products). Aluminum recovered from old scrap was equivalent to about $38 \%$ of apparent consumption.

Import Sources (2019-22): Canada, 52\%; United Arab Emirates, 8\%; Bahrain, 4\%; Russia, 4\%; and other, 32\%.

## ALUMINUM

Events, Trends, and Issues: In April, a U.S. primary aluminum producer acquired a majority stake in a company operating a bauxite mine and a 1.4-million-ton-per-year alumina refinery located in Jamaica. The Government of Jamaica did not object to the transaction and stated that the company would be responsible for investments to repair damage caused by a fire that shut down production in 2021. In May, a 4-year collective bargaining agreement was ratified at an aluminum rolling mill in Evansville, $I N$, while a 3 -year agreement was ratified at primary aluminum smelters in Warrick, IN, and Massena, NY. In October, a 3-year power deal was signed between the owner of a 229,000-ton-per-year primary aluminum smelter in Mt. Holly, SC, and its power provider. The contract is scheduled to remain in effect through 2026.

The United States announced a 200\% tariff on imported aluminum products and aluminum derivatives from Russia, effective March 10, and April 10, respectively. These ad valorem tariffs are authorized under section 232 of the Trade Expansion Act of 1962, which authorizes the President to impose trade restrictions when products are imported in a manner that threatens to impair national security.

In February, workers at a 228,000-ton-per-year primary aluminum smelter located in San Ciprian, Spain, approved a plan to restart the smelter in January 2024. Originally curtailed in 2021, the smelter is expected to return to $75 \%$ capacity by 2026. In March, a 230,000-ton-per-year primary aluminum smelter located in Neuss, Germany, began fully ramping down operations and a 358,000-ton-per-year primary aluminum smelter located in Victoria, Australia, reduced production by $75 \%$. In May, the operator of a 120,000-ton-per-year primary aluminum smelter in Podgorica, Montenegro, ceased operations and began permanent closure. In October, a 432,000-ton-per-year primary aluminum smelter located in British Columbia, Canada, returned to full production. The smelter has been operating at reduced production levels since 2018.

World Smelter Production and Capacity: Capacity data for China and the United States were revised based on company and Government reports.

|  | Smelter production |  | Yearend capacity |  |

World Resources: ${ }^{9}$ Global resources of bauxite are estimated to be between 55 billion and 75 billion tons and are sufficient to meet world demand for metal well into the future.

Substitutes: Composites can substitute for aluminum in aircraft fuselages and wings. Glass, paper, plastics, and steel can substitute for aluminum in packaging. Composites, magnesium, steel, and titanium can substitute for aluminum in ground transportation uses. Composites, steel, vinyl, and wood can substitute for aluminum in construction. Copper can replace aluminum in electrical and heat-exchange applications.
