EXPLANATION

Length of horizontal lines drawn across the lake level curves indicates the relative degree of development of shorelines, as follows:

- Moderate shoreline
  Weak shoreline for Fallon lakes
- Strong shoreline
- Very strong shoreline

Altitudes: ➔10 ft for Lake Lahontan shorelines;
≤1.3 ft for those of Fallon age.
Datum is mean sea level.

Shorelines of Eocene age generally cannot be further subdivided in age.
Most of the stronger ones are believed to date from the transgression of the first Eocene lake, and are arbitrarily shown as of this age.
