California's State Waters limit from NOAA Office of Coast Center (data collected by EarthData International in 34°25' shows inferred uppermost Pleistocene and Holocene nearshore and shelf deposits, which have maximum thickness of about 9 m on this transect but, in general, are thinner or altogether absent farther offshore. Which are roughly perpendicular to structural trend). Also shown is Molino gas field (see fig. 1–2 [in pamphlet] for location). Dashed yellow line is seafloor multiple (echo of seafloor reflector).
