

NOTE: Flood frequency was developed using Missouri rural regression equations (Alexander and Wilson, 1994). Basin characteristics used in regression equations were defined at State Highway N.

Estimate of flood inundation was produced by a simulated water-surface profile that incorporated a proposed channel realignment downstream from State Highway N. No observed flood data were available for proposed realignment to provide profile calibration. Limited information was available concerning floodplain elevations associated with realignment; therefore, simulated water-surface profile based on assumed floodplain elevations is based on best available information.

U.S. Geological Survey streamflow gage information available at <http://mo.water.usgs.gov>

STREAMFLOW GAGE AT STATE HIGHWAY N

STATION NUMBER	07061270
GAGE DATUM	825.26 FEET
GAGE READING	7.6 FEET

Base from Sorbus, Inc., proprietary to MACTEC Engineering and Consulting, Inc.
One half inch grid resolution, January 2006
Universal Transverse Mercator projection, Zone 15
Horizontal coordinate information referenced to the North American Datum of 1983 (NAD 83)

EXPLANATION
Flood inundation extent

Estimated Flood Inundation Extent Representing the 2-Year Flood Frequency at 3,720 Cubic Feet Per Second along the East Fork Black River
By
Paul H. Rydland, Jr.
2006
