

SUPPLEMENTARY STATEMENT TO PRELIMINARY REPORT 40

(December, 1952)

by

A. Samuel Keller and Robert H. Morris

Attached is the final compilation of the Shaviovik anticline structural data to be added to Preliminary Report 40 as plate 7. Inasmuch as no further information is available (December 1952), only minor changes have been made in the original interpretation. However, the base map used for plate 7 has been compiled by the Trimstrogon Section, Topographic Division, U. S. Geological Survey and is considered to be much more accurate than that used for the original contour map.

The only item worthy of note is the change in position of the contact of the Ignek formation and the Kavik formation at the eastern end of the map in the vicinity of structure traces 21 and 22. A re-evaluation of the geologic data would indicate that the contact closes about $1\frac{1}{2}$ miles farther west than was previously postulated.
