INTRODUCTION

As part of a cooperative marine research program designated the International Decade of Ocean Exploration (IDOE), the United States Geological Survey is participating in an investigation of the geologic framework and resource potential of continental margins and small ocean basins in the Gulf of Mexico, Caribbean Sea, and west African continental shelf areas. These studies are funded through the National Science Foundation. Acoustic-reflection profiles of Leg 1, described in this report concern mainly a 200 X 250 kilometer project area in the Bay of Campeche in the southwestern part of the Gulf of Mexico (fig. 1). The cruise leg began at Corpus Christi, Texas and ended at Veracruz, Mexico. Other geophysical records collected during the cruise include magnetometry, gravimetry, and bathymetry.

Visiting scientists from the Institute of Geophysics of the National University of Mexico, the Oceanographic Commission of the Mexican Navy, and the Mexican Institute of Petroleum joined the research vessel UNITEDGEO I throughout the cruise in the Bay of Campeche. The cruise offered an excellent opportunity for scientific interchange between investigators from Mexico and the United States and permitted collaboration in the instrumentation, operational techniques, and interpretation of acoustic-reflection records aboard the research vessel.

SCIENTIFIC PARTY

U.S. Geological Survey

G. W. Moore, Chief Scientist
Erk Reimnitz, Geologist
A. R. Tagg, Geologist
S. C. Wolf, Geologist
B. D. Ruppel, Geophysicist
H. L. Krivoy, Geophysicist
J. W. Lee, Electronics Technician
F. A. Lybolt, Electronics Technician

Mexican Participants

Luis del Castillo G., Geophysicist, and M. A. Calderon V., Assistant Geophysicist, National University of Mexico, Institute of Geophysics

Gustavo Calderon R., Oceanographer, Oceanographic Commission of Mexico

Leonardo Garcia A., Assistant Geophysicist, Mexican Institute of Petroleum

SHIP SCHEDULE

A total of 19 days was spent at sea in the Gulf of Mexico during Leg 1, which began at Corpus Christi on May 27, 1971 and ended at Veracruz on June 17, 1971. In addition, information collected in the Bay of Campeche during a 1-day run out of Veracruz at the start of Leg 2 has been made a part of the data of Leg 1. The subbottom acoustic profiles obtained between Corpus Christi and Veracruz and within the project area at the southwest corner of the Bay of Campeche near Veracruz were run at an average ship speed of 8.3 knots.

Day 147 (27 May 1971)	Left Corpus Christi
Day 151 (31 May 1971)	Arrived Veracruz; main Mexican team boarded
Day 153 (2 June 1971)	Left Veracruz
Day 158 (7 June 1971)	Refraction (sonobuoy) station no. 1
Day 161 (10 June 1971)	Dredge station
Day 166 (15 June 1971)	Refraction (sonobuoy) station no. 2
Day 168 (17 June 1971)	Arrived Veracruz at end of Leg 1
Day 170 (19 June 1971)	Left Veracruz to begin Leg 2
Day 172 (21 June 1971)	End Bay of Campeche survey

OBJECTIVES OF INVESTIGATION

Scientific objectives of this cruise leg were: (1) to define the details of folding and faulting on the west side of the Bay of Campeche; (2) to study the extension into the bay of the Mexican volcanic belt and related volcanic lineaments; (3) to investigate the origin of a belt of salt domes that extends along the floor of the east side of the basin; and (4) to acquire new evidence that might bear on the origin of the Gulf of Mexico.

GEOLOGIC SETTING

The area bordering the Bay of Campeche has a Paleozoic granitic and metamorphic basement overlain by Upper Jurassic redbeds, salt, and gypsum (Viniegra, 1971). These rocks are in turn overlain by thin-bedded Cretaceous and Paleocene sedimentary rocks upon which a thick sequence of coastal-plain sediment was deposited around the margin of the bay.

were within about 120 m (380 ft.) of a plotted average. Precision of satellite fixes while underway is estimated at about 180 m (600 ft.).

The radar system was a Decca RM 329, with 25 kw of power and a range up to about 65 km (40 mi.). A 9-foot wave-guide antenna giving a beam width of less than 1° at the half-power points provided high azimuth resolution. Accuracy of radar fixes, where used as primary control near the shore, is estimated at about 400 m (1200 ft.). Plotting was done on E. Uchupi's map titled "Map showing relation of land and submarine topography, Mississippi delta to Bahia de Campeche", which was published in 1968 in the U.S. Geological Survey's Miscellaneous Geologic Investigations Series as Map I-512.

Time for navigation and scientific records is referred to Greenwich Mean Time (Z), and days are numbered consecutively from the first day of the year. Scientific clocks were adjusted according to WWV radio.

Acoustic-Reflection System

The acoustic-reflection profiles were obtained using a sparker system consisting of separate, van-mounted, self-contained 160- and 120-kilojoule units triggered from a single source. Maximum total usable power was about 220 kilojoules. The triggered discharge of large capacitors through 6 twin-electrode "ladders" trailed behind the ship created sparks that produced the low-frequency acoustic pulse. These pulses were reflected from the sea bottom and from subbottom surfaces and were received and preamplified by a 100-hydrophone streamer. They were then selectively filtered and recorded graphically on a Raytheon recorder. The sparker ladders were trailed about 70 m behind the navigation antenna; the center of the hydrostreamer was at about 180 m.

Organization of profile records.--The subbottom acoustic profiles at the back of this report are presented in numerical order at approximately 1/5th scale. Many are shown reversed in order to facilitate comparison of structural and sedimentary features from profile to profile. All east-west profiles have been assembled with the west end at the left; thus, the user views such profiles as though looking northward. The start and end of each line are indicated, as are time marks every hour. Day notations are listed consecutively from day one of the year 1971. The records in this report were made between days 147 and 172 (May 27 to June 21). Hour marks shown on the profiles are in GMT and correspond with those on the detailed track chart (Plate 1, pocket).

The subbottom profiles were chiefly run at a 12-second firing rate and alternately gated 6-second sweep. Brief periods at the beginning of line 1 and at sonobuoy stations on lines 18 and 44 had a 6-second firing rate and 6-second sweep. Line 50 was run at a 4-second firing rate and 4-second sweep. The vertical scale shown on the acoustic profiles is two-travel time in seconds. The sparker energy source was generally set at 220 kj, but 80 kj was used on line 50, 120 kj on lines 1 and 48-49, 160 kj on lines 22a and 28, 165 kj on line 18, 180 kj on lines 35 and 40-46, 190 kj on lines 4 and 5, and 215 kj on lines 15 and 16. The filter band pass was generally 125/20 hz but was 98/20 hz for the first 1-1/2 hours on line 1 and 125/16 hz on line 50. The average vertical exaggeration of the sea-floor profile is about 10:1; the range is between 9:1 and 13:1.

Depth Recorder

A 3.5 khz Edo acoustic-reflection system was used as an echo-sounder and shallow-penetration subbottom profiler. Twelve transducers mounted in a sea chest in the ship's hull emitted a pulse signal programmed by a Giffit graphic recorder that provided uncorrected water depths in seconds (two-way travel time). These water depths were transcribed at quarter-hour intervals and, in conjunction with navigation fixes, were computer-processed using corrections from Matthews' tables. Computer output was printed at one-hour intervals and includes the position of each station, the observed depth in seconds, and the corrected depth in meters (Table 1).

Table 1.--Positions and depths expressed in two-way travel time and corrected meters along lines of Leg 1, Bay of Campeche, 1971.
