

**ANALYSES OF GROUND-WATER SAMPLES COLLECTED AT SPECIAL-STUDY SITES
MILL CREEK BASIN, STREAMBANK FENCING PROJECT**

Agriculture is the predominant land use in the Mill Creek Basin of Lancaster County, Pa., and much of the area along streams is used to pasture dairy cattle. Pastured areas have been identified as nonpoint sources of suspended sediment and nutrients to streams. Streambank fencing to exclude animal access is a best-management practice (BMP) that is targeted to reduce suspended-sediment and nutrient inputs to streams. The water-quality effects of specific BMP implementation, such as streambank fencing, on a basin scale are not well documented because of the typical occurrence of mixed land uses within a basin and the implementation of numerous BMPs on a basin-wide scale.

Presently, a cooperative project between the U.S. Geological Survey (USGS) and the Pennsylvania Department of Environmental Protection (PaDEP) is being conducted. The project is funded by PaDEP through the National Monitoring Program (NMP) of the U.S. Environmental Protection Agency. The NMP stems from Section 319 of the 1987 amendment to the Clean Water Act. The NMP was developed to document the effects of NPS pollution-control measures and associated land-use modifications on water quality. The objective of the project is to evaluate the effect of streambank fencing of pasture land on surface- and near-stream ground-water quality within a small watershed underlain by carbonate bedrock.

A paired-watershed approach was designed to quantify streambank-fencing effects. Data collection of surface water, shallow groundwater, and benthic-macroinvertebrate communities in the study basin began in 1993. Fence installation was started and finished in spring-summer 1997 with post-treatment data collection scheduled through water year 2001 and possibly beyond. The two watersheds are located within the Big Spring Run watershed which is a subbasin of the Mill Creek basin of Lancaster County (Fig. 5). The outlet of the control watershed (station number 01576521) drains 1.8 square miles with 2.7 total stream miles and about 2 miles of stream running through open pasture. The outlet of the treatment watershed (station number 01576529) drains 1.4 square miles with 2.8 total stream miles and about 2 miles of stream running through open pasture. Land uses in the basins are about 85 percent agriculture, 10 percent residential/commercial, and 5 percent forested. Agriculture in the two basins primarily involves crop production (mostly corn and alfalfa) and dairy farming.

Other sample locations for the study include five surface-water sites in the treatment basin (stations 01576525, 01576526, 015765265, 01576527, 01576528) and one surface-water site in the control basin (station 01576519). Data for these surface-water sites are shown in this report on pages 287-321. Two nests of wells (LN2037-LN2044) in the treatment watershed are also sampled monthly and are shown in tables in this report on pages 403-424. Additional sites sampled are given in table 2.

For additional information, contact Dan Galeone at the U.S. Geological Survey, 840 Market St., Lemoyne, PA 17043; 717-730-6952 (email dgaleone@usgs.gov).

TABLE 2.--Mill Creek Basin, streambank fencing project station list for well and spring sites sampled in water year 1999.

REMARKS.--Other data for this project presented in tables on pages 287-321 and 403-424.
