United States Department of the Interior

U.S. GEOLOGICAL SURVEY
Water Resources Division
Mountain View Office Park
810 Bear Tavern Road, Suite 206
West Trenton, New Jersey 08628

I am pleased to announce the release of our Annual report "Water Resources Data for New Jersey, Water Year 2000". This report was prepared by the U.S. Geological Survey, in cooperation with the State of New Jersey as well as many local and federal government agencies.

This report is again being published in three volumes:

Volume 1.--Surface-water streamflow data.

Volume 2.--Ground-water level data.

Volume 3 --Water-quality data.

This volume contains surface and ground water-quality data from the cooperative U.S. Geological Survey/ New Jersey Department of Environmental Protection Ambient Stream Monitoring Network (ASMN) and the Ambient Ground Water Quality Network (AGWQN), the Long Island-New Jersey Coastal Plain and Delaware River Basin National Water Quality Assessments (NAWQA) and New Jersey sites in the Landscape Indicators for Pesticides Mid-Atlantic Coastal Streams NAWQA study.

New to the Report this year are 2-5 day surveys of Temperature, Dissolved Oxygen, pH, and Specific Conductance from 15 ASMN stations and 2-3 month surveys of temperature from 23 Delaware River Basin NAWQA sites.

The New Jersey District of the U.S. Geological Survey has made a home page available on the world wide web. Real-time data for more than 30 stream-gaging stations around the State, peak-flow files for many gaging stations, ground-water level data, water-quality data, monthly hydrologic conditions and links to other sites of interest may be accessed. This information is available at:

<http://nj.usgs.gov/>

Copies of this report in paper or microfiche are for sale through the National Technical Information Service, U.S. Department of Commerce, Springfield, Virginia 22161. Data can also be provided by file transfer (ftp), or on floppy disk. When ordering, refer to U.S. Geological Survey Water-Data Report NJ-00-1 (for Volume 1), NJ-00-2 (for Volume 2), or NJ-00-3 (for Volume 3). For further information on this report, or to change or remove your address from our mailing list, please contact me at the above address, telephone (609) 771-3980, or send e-mail to wbauers@usgs.gov.

Sincerely,

William R. Bauersfeld, Chief
Hydrologic Data Assessment Program

PREFACE

This volume of the annual hydrologic data report of New Jersey is one of a series of annual reports that document hydrologic data gathered from the U.S. Geological Survey's surface- and ground-water data-collection networks in each State, Puerto Rico, and the Trust Territories. These records of water quality provide the hydrologic information needed by state, local, and federal agencies, and the private sector for developing and managing our Nation's land and water resources.

Hydrologic data for New Jersey are contained in 3 volumes:

- Volume 1. Surface-Water Data
- Volume 2. Ground-Water Data
- Volume 3. Water-Quality Data

This report is the culmination of a concerted effort by dedicated personnel of the U.S. Geological Survey who collected, compiled, analyzed, verified, and organized the data and who typed, edited, and assembled the report. The authors had primary responsibility for assuring that the information contained herein is accurate, complete, and adheres to U.S. Geological Survey policy and established guidelines. The following individuals contributed significantly to the completion of the report.

Jacob Gibs

Robert D. Schopp

Word processing of the report was done by H.L. Burns and A.M. Thomas, with technical support from M.D. Morgan. W.H. Ellis, J.P. Nawyn, G.L. Simpson, and D.K. Sun drafted the illustrations.

The data were collected, computed, and processed by the following personnel:

M.A. Ayers	V. Corcino, Jr.	G. Holzer	K. Murray	E.A. Pustay	G. Steckroat
M. Bilger	J.F. Dudek	J. Irvin	T. Oden	J. Rauth	
B. Boehlert	P. Dunne	W.D. Jones	K. Orlick	T.J. Reed	
R. Brightbill	J. Fischer	J. Klotz	R. Owre	R.G. Reiser	
G.A. Brown	K.L. Hibbs	P.J. Lacombe	E. Pritchett	K.M. Romanok	
G.L. Centinaro	R. Hickman	G.R. Long	A. Protz	A. Spehar	

Some data were collected by the following N.J. Department of Environmental Protection personnel:

A.A. Altieri	R.F. Fenton	C. Kunz	J.R. Specht
P. Burt	J. Janda	R. Maruska	

This report was prepared in cooperation with the State of New Jersey and with other agencies under the general supervision of William R. Bauersfeld, Chief of the Hydrologic Data Assessment Program; under the general supervision of David A. Stedfast, Associate District Chief; Eric Even-son, District Chief, New Jersey; and William J. Carswell, Jr., Regional Hydrologist, Northeastern Region.

13. ABSTRACT (Maximum 200 words)
Water-resources data for the 2000 water year for New Jersey are presented in three volumes, and consists of records of stage, discharge, and quality of streams; stage and contents of lakes and reservoirs; and levels and quality of ground water. Volume 3 contains a summary of surface and ground water hydrologic conditions for the 2000 water year, a listing of current water-resource projects in New Jersey, a bibliography of water-related reports, articles, and facts sheets for New Jersey completed by the Geological Survey in recent years, water-quality records of chemical analyses from 125 continuing-record surface-water stations, 62 miscellaneous surface-water sites, 73 ground-water sites, and records of daily statistics of temperature and other physical measurements from 45 continuous-recording stations. Locations of water-quality stations are shown in figures 18-20. Locations of miscellaneous water-quality sites are shown in figures 11 and 42-49. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating Federal, State, and local agencies in New Jersey.

14. SUBJECT TERMS New Jersey, hydrologic conditions, hydrologic data, surface-water analysis, ground-water analysis, streambed-material analysis, suspended-sediment concentration, continuing-record station, continuous-recording station, miscellaneous sampling site.	15. NUMBER OF PAGES 634

(File photograph, U.S. Geological Survey, West Trenton, New Jersey)

INTRODUCTION

The Water Resources Division of the U.S. Geological Survey (USGS), in cooperation with Federal, State, and local agencies, collects a large amount of data pertaining to the water resources of New Jersey each water year. These data, accumulated over many water years, constitute a valuable data base for developing an improved understanding of the water resources of the State. To make these data readily available to interested parties outside the USGS, the data are published annually in this report series, titled "Water Resources Data-New Jersey."

This report series includes records of stage, discharge, and quality of streams; stage, contents, and quality of lakes and reservoirs; and levels and quality of ground water. This volume contains water-quality records of chemical analyses from 125 continuing-record surface-water stations (figs. 18-20), and 3 continuous-recording surface-water stations. Additional water-quality data were collected at various sites that are not part of the systematic data collection program. Data were collected at 62 miscellaneous surface-water sites, 73 ground-water sites, and 42 continuous-recording sites (figs. 11 and 42-49). The data in this report represent that part of the National Water Information System (NWIS) data collected by the USGS and cooperating Federal, State, and local agencies in New Jersey.

This series of annual reports for New Jersey began with the 1961 water year with a report that contained only data relating to the quantities of surface water. For the 1964 water year, a similar report was introduced that contained only data relating to water quality. For water years 1975 through 1989, the report format was changed to present, in one volume, data on quantities of surface water, quality of surface and ground water, and ground-water levels. Beginning with the 1977 water year, these data were published in two volumes based on drainage basins. Beginning with the 1990 water year, the format was changed to include all surface-water discharge and surface-water quality records in Volume 1 and all ground-water level and ground-water quality records in Volume 2.

Prior to introduction of this series and for several water years concurrent with it, water-resources data for New Jersey were published in U.S. Geological Survey Water-Supply Papers. Data on stream discharge and stage and on lake or reservoir contents and stage, through September 1960, were published annually under the title "Surface-Water Supply of the United States, Part 1B." For water years 1961 through 1970, the data were published in two 5-year reports. Data on chemical quality, temperature, and suspended sediment for water years 1941 through 1970 were published annually under the title "Quality of Surface Waters of the United States," and water levels for water years 1935 through 1974 were published under the title "Ground-Water Levels in the United States." The above-mentioned Water-Supply Papers can be consulted in the libraries of the principal cities of the United States and can be purchased from U.S. Geological Survey, Branch of Information Services, Box 25286, Denver, CO 80225-0286, (303) 202-4610.

Publications similar to this report are produced annually by the USGS for all States. These reports have an identification number consisting of the two-letter State abbreviation, the last two digits of the water year, and the volume number. For example, this volume is identified as "U.S. Geological Survey Water-Data Report NJ-99-3." For archiving and general distribution purposes, the reports for water years 1971 through 1974 also are identified as water-data reports. Water-data reports are available for purchase in paper copy or in microfiche from the National Technical Information Service, U.S. Department of Commerce, Springfield, VA 22161.

Additional information, including current prices, for ordering specific reports can be obtained from the District Chief, USGS, New Jersey District, at the address given on the back of the title page of this report or by telephone ((609) 771-3900).

COOPERATION

The U.S. Geological Survey and agencies of the State of New Jersey have had joint-funding agreements for the collection of water-resource records since 1921. Organizations that assisted in collecting the data in this report through joint-funding agreements with the USGS are--

New Jersey Department of Environmental Protection, Robert C. Shinn, Jr., Commissioner

North Jersey District Water Supply Commission, Jerry Notte, General Manager

Passaic Valley Water Commission, Joseph A. Bella, Executive Director

Pinelands Commission, Annette M. Barbaccia, Executive Director

Delaware River Basin Commission, Carol R. Collier, Executive Director

New Jersey Water Supply Authority, Thomas Baxter, Executive Director

Funding assistance was provided by the U.S. Army Corps of Engineers (Philadelphia District)

The New Jersey Department of Environmental Protection aided in collecting records.

Organizations that supplied data are acknowledged in station descriptions.

SUMMARY OF HYDROLOGIC CONDITIONS

Surface Water Quality

Water year 2000 was marked by generally normal amounts of rainfall and stream discharge with noticeable increases in the late summer months. Monthly total precipitation was greater than long-term (1961-90) mean monthly precipitation during June through September at the Newark and Atlantic City National Weather Service stations and during August and September at the Trenton station (fig. 1). All monthly mean discharges at the three stream-discharge index stations, South Branch Raritan River at High Bridge, Great Egg Harbor River at Folsom, and Delaware River at Trenton, were within the range of historical (period of record prior to 2000 water year) maximum and minimum monthly mean values (fig. 2). Monthly mean discharge was greater than long-term (1960-90) median monthly values during June to August at the High Bridge station, August and September at Folsom, and March to September at Trenton.

Specific conductance (SC) is often used as an indicator of the concentration of dissolved solids. It is generally inversely related to stream discharge. The maximum monthly mean SC value for water year 2000 at the continuous monitoring station on the Delaware River at Trenton was recorded for September (fig. 3). The lowest monthly mean stream discharge for the year also was in September. The minimum monthly mean SC and the maximum monthly mean discharge were in March. Monthly mean SC values were lower than long-term (1968-99) mean monthly SC values during March to August when stream discharges were greater than long-term (1961-90) median monthly discharges. Monthly mean SC values were greater than long-term mean monthly SC values during November, January, and February when stream discharges were less than long-term median monthly discharges. All monthly mean SC values were within the range of historical (1968-99) maximum and minimum monthly mean SC values.

The monthly mean water-temperature values for the continuous monitoring station on the Delaware River at Trenton for water year 2000 were within the range of historical (1968-99) maximum and minimum monthly mean values (fig. 4). Monthly mean values recorded in November, December, January, and March were greater than long-term (1968-99) mean monthly values and were a result of unseasonably warm air temperatures during the winter season. According to the Northeast Regional Climate Center of Cornell University in *Climate Impacts*, the Northeast region continued a trend of warmer-than-normal months from December to March. The exception occurred during late January to early February when temperatures changed abruptly, averaging about 8 to 10 degrees below normal. Monthly mean values recorded in June through September were less than long-term mean monthly values and were caused by unseasonably cool spring and summer seasons. According to *Climate Impacts-July 2000*, in New Jersey, July 2000 was the second coolest July of record (1895-1999), with a statewide monthly average air temperature of 70.9°F (21.6°C).

Dissolved oxygen (DO) concentration generally exhibits an inverse relation to water temperature. As water temperature decreases, oxygen concentration increases; as water temperature increases, oxygen concentration decreases. DO, therefore, varies seasonally; yearly maximums occur in winter and yearly minimums occur in summer. Occasionally water clarity, sunlight variations, and algal photosynthesis and respiration rates affect the temperature-DO relation; extremes of DO concentration can occur irrespective of temperature extremes. The monthly medians of daily maximum and minimum DO concentrations at the continuous monitoring station on the Delaware River at Trenton for the 2000 water year were within the range of historical (1968-99) extreme monthly median values (fig. 5). The highest monthly median of the daily maximum DO concentrations, 15.2 milligrams per liter (mg/L), and the year's lowest monthly mean water temperature of 1.6°C, were recorded in February. The lowest monthly median of the daily minimum DO concentrations, 8.0 mg/L, was recorded in July and September; the year's highest monthly mean water temperature of 24.1°C was recorded in July.

Water-Column Nutrients and Common Ions in, and Physical Characteristics of, New Jersey Streams

Analyses for water-phase concentrations of total and filtered nutrients, filtered common ions, and biochemical oxygen demand (BOD) were performed on surface-water samples from 107 sites in the U.S. Geological Survey (USGS)/New Jersey Department of Environmental Protection (NJDEP) Cooperative Ambient Stream Monitoring Network (ASMN). Samples were collected at each site four times a year -- November to December, February to March, May to June, and August to September. Sites were classified in five categories. Six Background sites were located in undisturbed areas. Twenty-two Watershed Integrator sites were located at the farthest downstream point, not affected by tide, in one of the large drainage basins in each of the twenty watershed management areas, except areas 9 and 16. These sites reflected the cumulative effects of various land uses and point-source discharges. Each Land Use Indicator site monitored the effects of one of four designated land uses (undeveloped, agriculture, mixed, and urban) that occurred in each watershed management area. Ten of the Land Use Indicator sites were designated agriculture, 5 mixed, 13 undeveloped, and 13 urban. Statewide Status sites represented a randomly selected population of New Jersey streams; two sites were selected in each of the 20 watershed management areas. Seven of the Statewide Status sites were located at existing Watershed Integrator or Land Use Indicator sites. The Delaware River Main Stem category consisted of five sites. Water-column samples were collected at each site to assess water-quality constituents that might have been used as environmental indicators statewide. In addition to the regularly scheduled sampling, a Watershed Reconnaissance study is conducted annually to meet specific project needs. The purpose of the Watershed Reconnaissance study in water year 2000 was to assess 2-to-5-day diurnal dissolved oxygen levels at a subset of the network sites. This is discussed further in the section Ambient Stream Monitoring Network Reconnaissance Study.

Distributions of water temperature and concentrations of constituents measured in water-column samples collected during water year 2000 are presented in figures 6a and 6b as a function of site category, excluding the Delaware River Main Stem site category. Plots are presented for dissolved oxygen in percent of saturation during the growing season (April through October), water temperature, silica in filtered water, total ammonia, nitrite plus nitrate in filtered water, total nitrogen, total phosphorus, BOD, total dissolved solids (parameter code 70300), and filtered organic carbon. The analyzing laboratory used two different methods and reporting conventions for establishing the minimum concentration above which a quantitative measurement can be made. These reporting conventions were minimum reporting level (MRL) and laboratory reporting level (LRL). LRL was computed as twice the long term method detection level (LT-MDL). Values reported by the analyzing laboratory as less than the MRL or LRL were included in each distribution but were reported as a value equal to one-half the MRL or LT-MDL.

The lowest medians for water temperature, BOD, and concentrations of silica and total dissolved solids (TDS) were recorded at Background sites. The median values of silica in filtered water for all site types ranged from 5 to 9.2 milligrams per liter (mg/L). Samples from Statewide Status sites, which represent a random population of New Jersey streams, had a median silica concentration of 8.1 mg/L. Streams affected by wastewater and road salt runoff are likely to have high levels of TDS; samples from urban and Watershed Integrator sites had the highest median concentrations. In contrast, samples from Background sites had the lowest median TDS concentrations.

Box plots for the nutrient species (filtered ammonia, filtered nitrite plus nitrate, total nitrogen, and total phosphorus) seem to indicate that human activities are the greatest contributors to measurable nutrient levels in streams (fig. 6b). The highest median concentrations of ammonia and phosphorus were measured in samples from agricultural land use, urban land use, and Watershed Integrator site types, and most likely resulted from private, industrial, and municipal sewage; animal waste; and chemical fertilizers. As expected, samples from Background sites had the smallest range of concentrations and the lowest median concentrations.

The range of median concentrations of filtered organic carbon in samples from New Jersey streams historically has been from 4.0 to 5.0 mg/L. Median values measured in samples during water year 2000 ranged from 2.6 to 4.9 mg/L at all seven site types. Some undeveloped sites were located on streams that drained swamps and wetlands. Therefore, samples from undeveloped sites had the largest range of filtered organic carbon concentration, 1.25 to 30.41 mg/L, and the highest median concentration and highest value of all site types.

Trace Elements, Volatile Organic Compounds, and Organic Pesticides in New Jersey Streams

The presence of trace elements, volatile organic compounds (VOCs), and pesticides in New Jersey streams continued to be of great interest to water-resource managers and the public in general. The USGS/NJDEP ASMN has dem-

onstrated that many of these trace elements and organic compounds were present under ambient conditions in many New Jersey streams but at low concentrations.

Concentrations and frequencies of detection of selected whole-water recoverable trace elements, VOCs, and pesticides in samples from Background and Statewide Status sites are presented in figures 7a, 8, and 9, and tables 1, 2a, and 2b. Selected whole-water-recoverable and filtered trace elements with a high percentage of detections in samples (greater than 75 percent) are presented in box plots (fig. 7b). Constituents with a lower percentage of detections in samples are presented in scatter plots (fig. 7a). A detected compound is one whose value is reported to be greater than or equal to the laboratory's MRL. Estimated values, which were determined to be greater than the LT-MDL but less than the LRL, were included in the data for the scatter plots. They were marked with an "E" in the water-quality tables. Refer to "Laboratory Measurements" in the Introduction for additional information about estimated concentrations. Values reported by the analyzing laboratory as less than the MRL or LRL were included in the box plot distributions but were reported as a value equal to one-half the MRL or LT-MDL. The six Background sites were located in relatively pristine areas of New Jersey, such as state forests or national parks. Water-quality data from these sites constitute a baseline with which to compare the water quality of other sites. The 40 randomly chosen Statewide Status sites provide a general overview of the water quality in the state and the aerial distribution of those compounds. Samples analyzed for trace elements, VOCs, and pesticides were collected when the compounds were most likely to have been detected, during August and September, February and March, and May and June, respectively. Boron in filtered water was analyzed for in samples collected throughout the 2000 water year from all 107 sites in the ASMN. Data from the five Delaware River Main Stem sites were excluded from the distribution of boron in filtered water in figure 7b.

Concentrations and frequencies of detection of selected whole-water-recoverable trace elements in samples from New Jersey streams are shown in figure 7a. Beryllium, cadmium, mercury, selenium, and silver were not detected in any sample and so were not included in the figure. Data from the Background sites indicated infrequent detection and, when detected, low concentrations of trace elements. Of the six trace elements presented, chromium was detected twice; arsenic, boron, copper, and nickel were detected once; and lead was not detected in samples from Background sites. In contrast, these trace elements were detected in greater concentrations and frequencies in samples from Statewide Status sites.

Distributions of selected whole-water-recoverable and filtered trace elements in samples from selected sites in the ASMN are shown in figure 7b. Barium and manganese were detected in concentrations greater than the reporting limits in all 46 samples. Iron was detected in concentrations greater than the LRL in all but 2 of the 46 samples. Zinc was detected at greater than the MRL in all but 4 of the 46 samples, and filtered boron was detected at greater than the LRL in all but 32 of the 433 samples. Concentrations of boron in filtered water could result from human activities; samples from urban land-use sites had the highest median concentra-

tion and the highest single value. The median concentrations of boron in filtered water, whole-water-recoverable barium, iron, manganese, and zinc were lower in samples from Background sites than in samples from Statewide Status sites.

Concentrations and frequencies of detection of VOCs detected in samples from New Jersey streams are shown in figure 8 (those detected more than once) and are listed in table 1 (those detected only once). Samples were analyzed for the presence of 34 VOCs in each of 45 samples. Refer to individual station records to view concentrations from all 34 compounds in table form. Of the 14 compounds detected, only 2, chloroform and methyl tert-butyl ether (MTBE), were detected at low concentrations in samples from Background sites. The most frequently detected VOC, MTBE, was detected in 60 percent of all samples. The next most frequently detected VOC, Chloroform, was detected in 20 percent of all samples. VOCs are synthetic chlorinated compounds that are used as industrial solvents and degreasers; household and dry-cleaning agents; additives in paint, varnish, and adhesives; and components of, and additives to, gasoline.

Concentrations and frequencies of detection of organic pesticides in samples of filtered water from New Jersey streams are shown in figure 9 (those detected more than once) and listed in tables 2a (those with estimated concentrations) and 2b (those detected only once). Forty-seven compounds were analyzed for using USGS National Water Quality Laboratory schedule 2001; refer to "Laboratory Measurements" in the Introduction for the complete list. Twenty-four pesticides were detected in samples from Statewide Status sites and four in samples from Statewide Status and Background sites. Five of the detected compounds were insecticides-- Diazinon, Carbaryl, Carbofuran, Dieldrin, and Malathion. The remaining compounds were herbicides. The pesticides most frequently detected in the 45 samples collected were Metolachlor and Atrazine, which were detected in 87 percent of the samples; Deethylatrazine, in 80 percent; Prometon, in 60 percent; Simazine, in 51 percent; and Carbaryl, in 44 percent. Four widely used herbicides (Metolachlor, Atrazine, Deethylatrazine, and Prometon) were detected in samples from one or more Background sites; no insecticides were detected in samples from Background sites. One or more pesticides were detected in 36 of 39 samples (92 percent) from Statewide Status sites. One or more pesticides were detected in three of six samples (50 percent) from Background sites. The pesticides that were frequently detected in samples from throughout the State were present in low concentrations.

Ambient Stream Monitoring Network Reconnaissance Study

Field characteristics and concentrations of constituents in surface water monitored continuously at 18 selected stations during August or September 2000 are presented in figures 10a and 10b. The 18 stations included 12 stations in the Ambient Stream Monitoring Network, 3 continuous water-

quality monitoring stations, and 3 miscellaneous sites. The monitors at the continuous water-quality monitoring stations are permanent installations. The other 15 stations had temporary installations in place for 2 to 5 days. Monitoring took place during the late summer months. The study was intended to observe incidents of base-flow extremes of water temperature and percent of oxygen saturation and to document the occurrence and magnitude of diurnal dissolved oxygen fluctuations that cannot be observed during normal site visits between 8a.m. and noon. Of the 12 ASMN sites, 6 were Background sites, 3 were Land Use Indicator sites, and 3 were Watershed Integrator sites. Data from Background sites were needed to understand fluctuations of diurnal dissolved oxygen (DO) in pristine watersheds and to compare with data from other sites. The Land Use Indicator, Watershed Integrator, and miscellaneous sites were chosen on the basis of historical DO super-saturation (greater than 120 percent of saturation) or low DO (less than 60 percent of saturation).

Temperatures at the Background sites typically were lower than at other sites because of their locations in forested watersheds. The DO concentrations at the Background sites were greater than 6 mg/L, except at site 01466500, McDonald's Branch in Lebanon State Forest. This site is recharged by ground water that typically has low concentrations of DO. The minimum DO values at the other sites ranged from 4.0 to 8.6 mg/L. The maximum values ranged from 4.5 to 11.3 mg/L. Three sites exhibited minimum percent of DO saturation values less than 60 percent-- Background site 0146500, McDonald's Branch in Lebanon State Forest; Miscellaneous site 01379000, Passaic River near Millington; and agriculture Land Use Indicator site 01464515, Doctors Creek at Allentown. They historically have had low DO values during routine sampling visits. Three sites exhibited maximum percent of DO saturation values greater than 110 percent-- Watershed Integrator site 01398102, South Branch Raritan River at South Branch; undeveloped Land Use Indicator site 01440000, Flat brook at Flatbrookville; and Delaware River Main Stem site 01463500, Delaware River at Trenton. They historically have had high DO values.

Four sites-- 01378560, 01381800, 01391100, and 01391500-- had wide variation of minimum, mean, and maximum specific conductance (SC) measured during respective periods of record. These sites are different from those with extreme values (<60 percent and >110 percent) of percent of DO saturation. The lowest continuously monitored pH occurred at two Background sites, 01411955 and 01466500.

In addition to the summary of statistics in figures 10a and 10b, plots of field characteristics measured every half-hour for the period of record by the monitors at the 12 network sites are available in this volume. Refer to the individual station records for plots of DO concentration, percent of DO saturation, pH, specific conductance, and water temperature.

WATER RESOURCES DATA-NEW JERSEY, 2000

EXPLANATION

- UNSHADED AREA--Indicates range between highest and lowest mean discharge recorded for the month, prior to 2000 water year
- BROKEN LINE--Indicates normal discharge (median of the monthly means) for the standard reference period, 1961-90
- SOLID LINE--Indicates observed monthly mean discharge for the 2000 water year

Figure 2. Monthly mean discharge at index gaging stations.

EXPLANATION

UNSHADED AREA--Indicates the range between the highest monthly mean values and the lowest monthly mean values, water years 1968-99.

SOLID LINE--Indicates the monthly mean values for water year 2000.

BROKEN LINE--Indicates the mean monthly values for water years 1968-99.

Figure 3. Monthly mean specific conductance at Delaware River at Trenton, New Jersey.

WATER RESOURCES DATA-NEW JERSEY, 2000

Ground Water Quality

The Ambient Ground-Water-Quality Network (AGWQN) was designed to monitor the quality of ground water at or near the water table. Shallow ground water is generally the first and most significantly affected part of the ground-water system, and the quality of this water is directly related to human activities at land surface. The USGS/NJDEP AGWQN has four goals. The first goal is to assess the status of ground-water quality by examining the concentrations of various constituents that can be used as environmental indicators. The second goal is to assess water-quality trends by examining data collected on a 5-year cycle. The third goal is to determine the effects of land use on shallow ground-water quality, and the final goal is to identify threats from non-point sources and to identify emerging or new environmental issues of concern to the public.

The network consists of 150 shallow wells distributed throughout New Jersey within three land-use types. Sixty wells are, or will be located, in agricultural areas, 60 in urban/suburban areas, and 30 in undeveloped areas within New Jersey's five watershed management regions (WMR)--the Passaic, the Raritan, the Upper Delaware, the Lower Delaware, and the Atlantic Coastal. These five WMRs were further divided into 20 watershed-management areas (WMA). Every year approximately 30 sites are sampled in one or several of the five WMRs. The full cycle of 150 wells will be completed in five years.

Thirty shallow wells were sampled in 2000. Fourteen wells are in the Lower Delaware Region of New Jersey and are distributed throughout WMA 17-20 (fig. 11). Sixteen wells are in the Atlantic Coastal Region and are distributed throughout WMA 13-16. Twenty-two wells are screened in the Kirkwood-Cohansey aquifer system; one in the Mount Laurel Sand; one in the undifferentiated sediments of Holocene, Pleistocene, Pliocene, or Miocene age; one in the Merchantville Formation; one in the Upper Aquifer of the Potomac-Raritan-Magothy aquifer system; two in the Englishtown aquifer system, and two in the Marshalltown Formation (table 3). The wells have polyvinyl-chloride casings and range in depth from 8 to 49 feet. Three were drilled in 1996; the other 27 were drilled during March through September 2000. Samples from the wells were analyzed for physical characteristics, major ions, nutrients, trace elements, organic constituents, and gross alpha and beta radioactivity. The tables of chemical constituents are in the section, "Water-Quality Records at Miscellaneous Ground-Water Sites."

Common Ions, Nutrients, and Trace Elements in, and Physical Characteristics of, Shallow Ground Water

Plots of selected constituent concentrations measured in ground-water samples collected throughout the Lower Delaware and Atlantic Coastal regions during August and September 2000, as a function of land-use designation, are shown in figures 12 through 15. Constituents with a high percentage of detections in the samples (greater than 75 percent) are presented in box plots (figs. 12a and 12b). Values reported by the analyzing laboratory as less than the MRL, or LRL if applicable, were included in each box plot but

were reported as a value equal to one-half the MRL or LT-MDL. Constituents with a lower percentage of detections in the samples also are presented in scatter plots (figs. 14 and 15). The scatter plots include estimated values that were determined to be greater than the LT-MDL but less than the LRL. Refer to "Laboratory Measurements" in the Introduction for additional information about estimated concentrations. The trilinear diagrams in figures 13a, 13b, and 13c, and the "Water Type" column (column 5) in table 3 are grouped by land-use type and summarize the major ion chemistry of the water from each well.

The box plots highlight the differences in ground-water chemistry among wells located in areas with agricultural, undeveloped, and urban land-use designations. Median water temperature and median concentrations of hardness, total dissolved solids, chloride, manganese, iron, and organic carbon were lower in samples from wells in undeveloped areas than in those in other land-use areas (figs. 12a and 12b). Median concentrations of chloride and iron were greatest in samples from wells in urban areas. The median concentration of iron, for instance, was two orders of magnitude greater in samples from wells in urban areas than in samples from wells in undeveloped areas. The lowest median DO concentration, approximately 2 mg/L, was measured in water from wells in urban areas; the median concentration in water from wells in agricultural and undeveloped areas was from 4 to 5 mg/L. The highest median concentration of aluminum, 602 micrograms per liter (mg/L), was measured in samples from wells in undeveloped areas; the lowest median concentration, 65 mg/L, was measured in samples from wells in urban areas. The highest median concentrations of zinc, 19 mg/L, was measured in samples from wells in both undeveloped and urban areas. Agricultural practices appear to have the greatest effect on calcium and magnesium concentrations; the highest median concentration of hardness, 78 mg/L as calcium carbonate, was measured in samples from wells in agricultural areas.

Concentrations of ammonia nitrogen were low in samples from all three land-use types (fig. 14). Frequencies of detection of concentrations above the MRL of 0.03 mg/L in samples from wells in urban, undeveloped, and agricultural areas were 33, 21, and 14 percent, respectively. The highest median nitrite plus nitrate concentration, 10.90 mg/L, was measured in samples from wells in agricultural areas; the lowest, 0.41 mg/L, was measured in samples from wells in undeveloped areas. The lowest frequency of detection, 14 percent, was for samples from wells in undeveloped areas. Frequencies of detection of concentrations of ortho-phosphorus above the MRL of 0.01 milligrams per liter in samples from wells in urban, undeveloped, and agricultural areas were 33, 0, and 29 percent, respectively.

The following trace elements were detected at concentrations greater than their respective reporting limits in samples from wells with all three land-use designations: arsenic, with an MRL of 0.9 mg/L; barium, MRL of 1.0 mg/L; chromium, LT-MDL of 0.4 mg/L; copper, MRL of 1.0 mg/L; and selenium, MRL of 0.7 mg/L (fig. 15). Barium was detected in 100 percent of the samples. Arsenic, chromium, copper, and selenium were detected most frequently in samples from wells in agricultural areas (57, 57, 86, and 86 percent of those wells, respectively). Cadmium was detected in just

one sample from a well with an urban land-use designation. Lead was detected in four samples (three of the samples were from wells in agricultural areas), and mercury was detected in three samples (two of the samples were from wells in agricultural areas). Silver was not detected at any well and, therefore, is not included in the figure.

Volatile Organic Compounds and Organic Pesticides in Shallow Ground Water

A list of the frequencies of detection of volatile organic compounds (VOC) detected in ground-water samples collected throughout the Lower Delaware and Atlantic Coastal regions is presented in table 4. Each sample was analyzed for the presence of 34 VOCs. Only VOCs detected in one or more samples are listed in table 4. Refer to individual station records to view concentrations of all 34 compounds in table form. Chloroform was the most frequently detected VOC (43 percent of all samples) in samples from wells in all land-use areas. The second most frequently detected VOC, Methyl tert-butyl ether (20 percent of all samples), was detected in samples from wells in urban and agriculture areas. The third most frequently detected VOC, Toluene, was detected in 1 of 14 samples from wells in undeveloped areas and in 1 of 9 samples from wells in urban areas. 1,4-Dichloropropane, cis-1,2-Dichloroethene, Dichlorobromomethane, Diisopropyl ether, tert-Pentyl methyl ether, and Tetrachloroethylene were each detected only once.

Concentrations and frequencies of detection of organic pesticides in filtered ground-water samples collected throughout the Lower Delaware and Atlantic Coastal regions are shown in figure 16 (those most frequently detected) and listed in tables 5a (those with estimated concentrations) and 5b (those detected only once). Forty-seven compounds were analyzed for using USGS National Water Quality Laboratory schedule 2001; refer to "Laboratory Measurements" in the Introduction for the complete list. The plots include estimated values that were determined to be greater than the LTMDL but less than the LRL. The most frequently detected pesticides in samples from wells in all land-use areas were Metolachlor (23 percent), Atrazine (20 percent), Deethylatrazine (17 percent), Simazine (10 percent), Prometon (10 percent), Alachlor, Carbaryl, Dacthal, and Diazinon (7 percent each). Ten widely used herbicides and four widely used insecticides were detected in samples from seven wells in agricultural areas. The most frequently detected herbicides in samples from wells in agricultural areas were Metolachlor (71 percent), Atrazine (57 percent), Deethylatrazine (57 percent), Alachlor (29 percent), Simazine (29 percent), and Dacthal or DCPA (29 percent). The insecticides Carbaryl, Diazinon, Dieldrin, and p,p-DDE were each detected once in samples from wells in agricultural areas. Six widely used herbicides and two widely used insecticides were detected in samples from nine wells in urban areas. The most frequently detected herbicides in samples from wells in urban areas were Atrazine, Metolachlor, and Prometon (22 percent each); the insecticides Carbaryl and Malathion were each detected once. Diazinon, an insecticide, and Propanil, an herbicide, were the only two compounds detected in samples from wells in undeveloped areas.

Saltwater-Monitoring Network

The potability of ground water in the Coastal Plain of New Jersey depends primarily on its chemical quality, including contamination with saltwater. Chloride concentration is an accurate index of the extent and degree of saltwater contamination. The presence of high concentrations of chloride, however, is not definitive proof of active saltwater intrusion; high concentrations may represent a natural, static condition. Saltwater intrusion can be documented by analysis of periodically collected water samples. Saltwater intrusion is indicated by increases in chloride concentration over time rather than by a single concentration measured at one point in time.

In the 1940's, the USGS established a saltwater-monitoring network in the Coastal Plain of New Jersey to document the movement of saltwater into the freshwater aquifers. The USGS collects and analyzes water samples from USGS and NJDEP observation wells and selected domestic and agricultural supply wells. Chloride measurements are augmented by chloride-concentration data reported to the NJDEP by owners of public and industrial supply wells. During the 2000 water year, the USGS sampled water from thirteen wells in seven counties. Chloride concentrations in these samples were supplemented by more than 6,000 values that were reported by hundreds of public and industrial supply well owners and are stored in NJDEP and USGS files.

During the 2000 water year, saltwater intrusion was evident in many communities along Raritan Bay, the Atlantic Coast, the Delaware Bay, and the lower Delaware River, and in central Gloucester County.

SPECIAL NETWORKS AND PROGRAMS

The USGS/New Jersey Department of Environmental Protection (NJDEP) cooperative Ambient Stream Monitoring Network (ASMN) and Ambient Ground Water Quality Network (AGWQN) are designed to meet the expanding need for surface and ground-water-quality data in the State of New Jersey. The major objectives of the network are to (1) support the National Environmental Performance Partnership System agreement (a program set up to control long-term environmental planning) and the watershed-management process; (2) to work synergistically with the NJDEP Ambient Biomonitoring Network, and atmospheric, ground-water, and coastal water-quality networks; (3) determine statewide water-quality status and trends; (4) measure water-quality near the downstream end of each Watershed Management Area (WMA); (5) define background water quality in each of the four physiographic provinces of New Jersey; (6) measure nonpoint-source contributions from major landuse areas, atmospheric deposition, and ground-water; (7) facilitate response of state and local water-management officials to emerging or watershed-specific water-quality issues.

The surface-water network consists of 107 stations located in 20 WMA's. These stations are segregated into five distinct types that together are used to define the surface-water-quality in the State. Background stations are located on reaches of streams that have remained relatively unaffected by human activity, to develop a baseline water-quality data base. Data from these sites are used in the development of water-quality standards and initiatives. Watershed Integra-

¹Land use based on New Jersey Department of Environmental Protection 1986 ITU with subsequent field verification.

²Includes compounds with estimated concentrations, defined as positive detections of a compound, but measured as less than the laboratory's reporting levels.

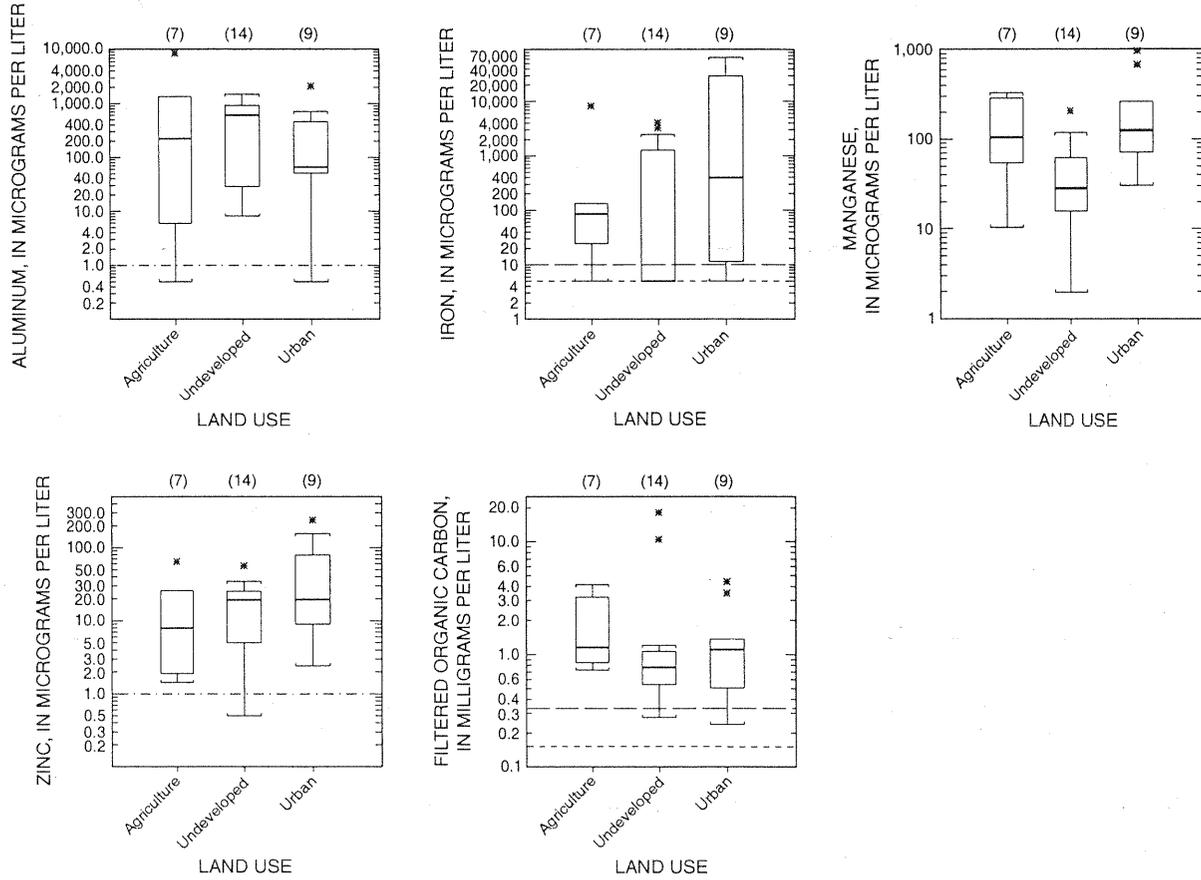

EXPLANATION

- (10) Number of observations
- * Outlier data value less than or equal to 3 and more than 1.5 times the interquartile range outside the quartile
- Data value less than or equal to 1.5 times the interquartile range outside the quartile
- 75th percentile
- Median
- 25th percentile
- Minimum reporting level

Figure 12a. Distribution of selected constituents in filtered water in, and physical characteristics of, ground water from 30 sites in the Ambient Ground-Water-Quality Network, water year 2000. ["Less-than" values are report as equal to one-half the minimum reporting level (MRL) or long term method detection level (LTMDL).]

tor stations are located at the furthest downstream point possible in each WMA to provide information on the combined water-quality effects within each WMA. Land Use Indicator stations are used to monitor the effects of the dominant land use in each WMA and provide data on nonpoint-source loading of contaminants to streams. Statewide Status stations are chosen randomly each year within the 20 WMA's to obtain a statistical basis that can be used to estimate water-quality indicators statewide. Five stations are located on the Delaware Main Stem - the border between New Jersey and Pennsylvania. Watershed Reconnaissance stations are also selected annually on the basis of specific project needs, determined by a committee of USGS and NJDEP personnel.

The surface-water network is sampled in four periods throughout the water year: November 1 to December 31, February 1 to March 31, May 1 to June 30, and August 1 to September 30. Samples for analysis for nutrients, major ions, and biochemical oxygen demand are collected from the entire network each sampling period. Samples for the analysis of water-column volatile organic compounds during February and March, filtered organic pesticides during May and June, and whole-water-recoverable trace elements during August and September are collected at all Statewide Status and Background stations. Samples for the analyses of trace elements and polyaromatic hydrocarbons in streambed sediments are also collected in August and September at 20 Statewide Status and 2 Background stations.

The Ambient Ground-Water-Quality Network (AGWQN) is designed to monitor the water quality of shallow wells. The quality of water from wells located at the water table is generally the first and most significantly affected part of the ground water system, and can be directly related to human activity at the land surface. The ground-water network consists of 150 sites distributed throughout the State of New Jersey within three land-use types. Sixty wells are, or will be located, in agricultural areas, 60 in urban/suburban areas, and 30 in undeveloped areas. These areas are located throughout New Jersey's five Watershed Management Regions (WMR), which are further divided into 20 watershed-management areas (WMA) (fig. 11). The Passaic Region consists of WMAs 3-6; the Lower Delaware Region is composed of WMAs 17-20; the Raritan Region is made up of WMAs 7-10; the Upper Delaware Region includes WMAs 1, 2, and 11; and, the Atlantic Coastal Region consists of WMAs 12-16. Approximately 30 wells in one or several of the five WMR are sampled each year. Thus, the entire network is sampled over a 5-year cycle. During the 2000 water year, 30 wells in the Lower Delaware and Atlantic Coastal Regions were sampled. Samples from these wells were analyzed for physical characteristics, major ions, nutrients, trace elements, organic constituents, and radioactivity.

Hydrologic Benchmark Network is a network of 50 sites in small drainage basins around the country whose purpose is to provide consistent data on the streamflow representative undeveloped watersheds nationwide, and to provide analyses on a continuing basis to compare and contrast conditions observed in basins more obviously affected by human activities. At 10 of these sites, water-quality information is being gathered on major ions and nutrients, primarily to assess the affects of acid deposition on stream chemistry. Additional information on the Hydrologic Benchmark Program can be found at <http://water.usgs.gov/hbn/>.

National Stream-Quality Accounting Network (NASQAN) monitors the water quality of large rivers within the Nation's largest river basins. From 1995 through 1999, a network of approximately 40 stations were operated in the Mississippi, Columbia, Colorado, and Rio Grande. From 2000 through 2004, sampling was reduced to a few index stations on the Colorado and Columbia so that a network of 5 stations could be implemented on the Yukon River. Samples are collected with sufficient frequency that the flux of a wide range of constituents can be estimated. The objective of NASQAN is to characterize the water quality of these large rivers by measuring concentration and mass transport of a wide range of dissolved and suspended constituents, including nutrients, major ions, dissolved and sediment-bound heavy metals, common pesticides, and inorganic and organic forms of carbon. This information will be used (1) to describe the long-term trends and changes in concentration and transport of these constituents; (2) to test findings of the National Water-Quality Assessment Program (NAWQA); (3) to characterize processes unique to large-river systems such as storage and re-mobilization of sediments and associated contaminants; and (4) to refine existing estimates of off-continent transport of water, sediment, and chemicals for assessing human effects on the world's oceans and for determining global cycles of carbon, nutrients, and other chemicals. Additional information about the NASQAN Program can be found at <http://water.usgs.gov/nasqan/>.

The National Atmospheric Deposition Program/ National Trends Network (NADP/NTN) provides continuous measurement and assessment of the chemical constituents in precipitation throughout the United States. As the lead federal agency, the USGS works together with over 100 organizations to provide a long-term, spatial and temporal record of atmospheric deposition generated from a network of 225 precipitation chemistry monitoring sites. This long-term, nationally consistent monitoring program, coupled with ecosystem research, provides critical information toward a national scorecard to evaluate the effectiveness of ongoing and future regulations intended to reduce atmospheric emissions and subsequent impacts to the Nation's land and water resources. Reports and other information on the NADP/NTN Program, as well as all data from the individual sites, can be found at <http://bqs.usgs.gov/acidrain/>.

The National Water-Quality Assessment (NAWQA) Program of the U.S. Geological Survey is a long-term program with goals to describe the status and trends of water-quality conditions for a large, representative part of the Nation's ground- and surface-water resources; provide an improved understanding of the primary natural and human factors affecting these observed conditions and trends; and provide information that supports development and evaluation of management, regulatory, and monitoring decisions by other agencies.

Assessment activities are being conducted in 59 study units (major watersheds and aquifer systems) that represent a wide range of environmental settings nationwide and that account for a large percentage of the Nation's water use. A wide array of chemical constituents are measured in ground water, surface water, streambed sediments, and fish tissues. The coordinated application of comparative hydrologic studies at a wide range of spatial and temporal scales will provide information for decision making by water-resources managers and a foundation for aggregation and comparison

of findings to address water-quality issues of regional and national interest.

Communication and coordination between USGS personnel and other local, State, and federal interests are critical components of the NAWQA Program. Each study unit has a local liaison committee consisting of representatives from key federal, State, and local water resources agencies, Indian nations, and universities in the study unit. Liaison committees typically meet semiannually to discuss their information needs, monitoring plans and progress, desired information products, and opportunities to collaborate efforts among the agencies. Additional information about the NAWQA Program is available through the world wide web at http://water.usgs.gov/nawqa/nawqa_home.html

Long Island-New Jersey Coastal Plain (LINJ) NAWQA fixed station published in this report (fig. 19) is: Raritan River at Queens Bridge, at Bound Brook, NJ (01403300).

Delaware River Basin (DELR) NAWQA fixed stations published in this report (fig. 20) are: Delaware River at Port Jervis, NY (01434000); Jordan Creek near Schnecksville, PA (01451800); Lehigh River at Glendon, PA (01454700); Delaware River at Trenton, NJ (01463500); Little Neshaminy Creek at Valley Rd. near Neshaminy, PA (01464907); Cooper River at Haddonfield, NJ (01467150); Tulpehocken Creek near Bernville, PA (01470779); French Creek near Phoenixville, PA (01472157); Schuylkill River at Philadelphia, PA (01474500); and Raccoon Creek near Swedesboro, NJ (01477120).

Water-quality data were collected at 43 additional surface-water synoptic sites in the Piedmont and Valley and Ridge Physiographic Provinces as part of the DELR NAWQA study. Data were collected as part of a synoptic survey of nutrients, pesticides, major ions, and dissolved organic carbon. Most sampling was conducted from May 15 through June 27. The sampling was repeated from September 11 through October 16 at 33 of the 43 synoptic sites. The 10 sites that were only collected during the May/June synoptic are printed in italics in the text below. Synoptic survey data are published in this report in the section titled "Water Quality at Miscellaneous Sites". These sites are (fig. 42): Neversink River near Claryville, NY (0143500); Flat Brook near Flatbrookville, NJ (01440000); *Paulins Kill at Blairstown, NJ (01443500)*; *Lizard Creek at Ashfield, PA (01450400)*; *Buckwha Creek at Little Gap, PA (01450455)*; *Hokendauqua Creek near Northampton, PA (01451110)*; *Little Lehigh Creek near East Texas, PA (01451425)*; *Cedar Creek Above Lake Muhlenberg at Allentown, PA (01451624)*; *Monocacy Creek at Bethlehem, PA (01452500)*; Tincum Creek near Smittstown, PA (01458920); Locketong Creek at Raven Rock, NJ (01460880); Alexhauken Creek near Lambertville, NJ (01461900); Pidcock Creek near New Hope, PA (01462100); Jacobs Creek at Somerset, NJ (01462800); Buck Creek below Brock Creek at Yardley, PA (01462949); Shabakunk Creek near Lawrenceville, NJ (01463810); Pine Creek at Chalfont, PA (01464710); Mill Creek near Langhorne, PA (01465470); North Branch Rancocas Creek at Pemberton, NJ (01467000); Pennypack Creek at Paper Mill, PA (01467040); Tacony Creek at Cheltenham, PA (0146708450); *Ontelaunee Creek at Wanamakers, PA (01470640)*; *Mill Creek at Dietricks Mill Bridge near Kutztown, PA (01470744)*; *Little Northkill Creek near Bernville, PA (01470818)*; Wyomissing Creek at West Reading,

PA (01471520); Hay Creek near Scarlets Mill, PA (01471667); Manatawny Creek near Pottstown, PA (01471980); Pigeon Creek near Parker Ford, PA (01472100); Pickering Creek at Charlestown Road Bridge, at Charlestown, PA (014721884); Macoby Creek at Green Lane, PA (01472280); Stony Creek at Steriger Street at Norristown, PA (01473470); Darby Creek at Foxcroft, PA (01475430); Darby Creek near Darby, PA (01475510); Cobbs Creek at East Lansdowne, PA (01475543); Crum Creek at Goshen Road near Whitehorse, PA (01475845); Ridley Creek near Media, PA (01476470); West Branch Chester Creek near Chester Heights, PA (01476950); Middle Branch White Clay Creek near Landenberg, PA (01478200); East Branch Red Clay Creek near Five Point, PA (01479800); West Branch Brandywine Creek at Cedar Knoll, PA (01480350); East Branch Brandywine Creek near Dorlan, PA (01480665); Beaver Creek near Downingtown, PA (01480775); Valley Creek near Altort, PA (01480890).

Bed-sediment data were collected at 11 surface-water sites as part of the DELR NAWQA study. Data were collected as part of a survey of organics and trace elements in bed sediment. Sampling was conducted from June 12 through July 26. Bed-sediment data are published in this report in the section titled "Water Quality at Miscellaneous Sites". These sites are (fig. 44): Pidcock Creek near New Hope, PA (01462100); Shabakunk Creek near Lawrenceville, NJ (01463810); Pine Creek at Chalfont, PA (01464710); Little Neshaminy Creek at Valley Road near Neshaminy, PA (01464907); Pigeon Creek near Parker Ford, PA (01472100); French Creek near Phoenixville, PA (01472157); Stony Creek at Steriger Street at Norristown, PA (01473470); Darby Creek at Foxcroft, PA (01475430); Crum Creek at Goshen Road near Whitehorse, PA (01475845); Ridley Creek near Media, PA (01476470); East Branch Brandywine Creek near Dorlan, PA (01480665).

Fish-community surveys were conducted at 7 surface-water indicator sites as part of the DELR NAWQA study. Sampling was conducted from July 10 through July 21. Fish-community data are published in this report in the section titled "Water Quality at Miscellaneous Sites". These sites are (fig. 45): Flat Brook near Flatbrookville, NJ (01440000); Jordan Creek near Schnecksville, PA (01451800); Little Neshaminy Creek at Valley Road near Neshaminy, PA (01464907); Cooper River at Haddonfield, NJ (01467150); Tulpehocken Creek near Bernville, PA (01470779); French Creek near Phoenixville, PA (01472157); and Raccoon Creek near Swedesboro, NJ (01477120).

EXPLANATION OF THE RECORDS

The surface-water records published in this report are for the 2000 water year that began October 1, 1999, and ended September 30, 2000. A calendar of the water year is provided on the inside of the front cover. The records contain surface-water and ground-water-quality data. The locations of the stations where the data were collected are shown in figures 11, 18-20, and 47-49. The following sections of the introductory text are presented to provide users with a more detailed explanation of how the hydrologic data published in this report were collected, analyzed, computed, and arranged for presentation.

Station Identification Numbers

Each data station in this report is assigned a unique identification number. This number is unique in that it applies specifically to a given station and to no other. The number usually is assigned when a station is first established and is retained for that station indefinitely. The systems used by the U.S. Geological Survey to assign identification numbers for surface-water stations and for ground-water well sites differ, but both are based on geographic location. Generally the "downstream order" system is used for regular surface-water stations and the "latitude-longitude" system is used for wells.

Downstream Order System

Since October 1, 1950, the order of listing hydrologic-station records in Survey reports is in a downstream direction along the main stream. All stations on a tributary entering upstream from a mainstream station are listed before that station. A station on a tributary that enters between two mainstream stations is listed between them. A similar order is followed in listing stations on first rank, second rank, and other ranks of tributaries. The rank of any tributary with respect to the stream to which it is immediately tributary is indicated by an indentation in the "List of Stations" in the front of this report. Each indentation represents one rank. This downstream order and system of indentation shows which stations are on tributaries between any two stations and the rank of the tributary on which each station is situated.

The station-identification number is assigned according to downstream order. In assigning station numbers, no distinction is made between partial-record stations and other stations; therefore, the station number for a partial-record station indicates downstream-order position in a list made up of both types of stations. Gaps are left in the series of numbers to allow for new stations that may be established; hence, the numbers are not consecutive. The complete eight-digit number for each station, such as 01396500, which appears just to the left of the station name, includes the two-digit Part number "01" plus the 6-digit downstream-order number "396500". The Part number designates the major drainage basin; for example, Part "01" covers the North Atlantic slope basins. In some areas where all 8-digit numbers are used up, 10-digit station numbers are assigned between the 8-digit numbers.

Latitude-Longitude System

The identification numbers for wells and miscellaneous surface-water sites are assigned according to the grid system of latitude and longitude (fig. 16). The number consists of 15 digits. The first six digits denote the degrees, minutes, and seconds of latitude, the next seven digits denote degrees, minutes, and seconds of longitude, and the last two digits (assigned sequentially) identify the wells or other sites within a 1-second grid. This site-identification number, once assigned, is a pure number and has no locational significance. In the rare instance where the initial determination of latitude and longitude are found to be in error, the station will retain its initial identification number; however, its true latitude and longitude will be listed in the LOCATION para-

graph of the station description.

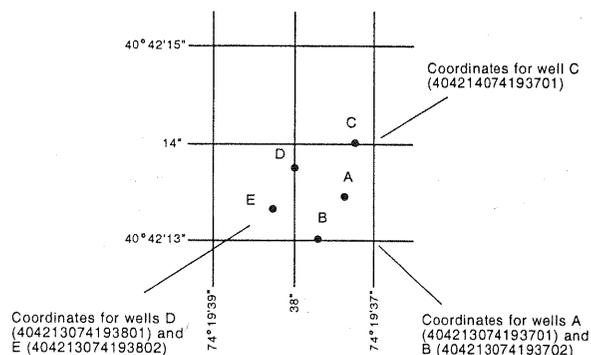

Figure 17.--System for numbering wells and miscellaneous sites (latitude and longitude)

Water Quality Records

Records of surface-water quality ordinarily are obtained at or near stream-gaging stations because interpretation of records of surface-water quality nearly always requires corresponding discharge data. Records of surface-water quality in this report may involve a variety of types of data and measurement frequencies. Locations of stations for which records on the quality of surface water appear in this report are shown in figures 18-20, and 42-46.

Classification of Records

Water-quality data for surface-water sites are grouped into one of three classifications. A continuing-record station is a site where data are collected on a regularly scheduled basis. Frequency may be one or more times daily, weekly, monthly, or quarterly. A partial-record station is a site where limited water-quality data are collected systematically over a period of years. Frequency of sampling is usually less than quarterly. A miscellaneous sampling site is a location other than a continuing or partial-record station where random samples are collected to give better areal coverage to define water-quality conditions in the river basin.

A careful distinction needs to be made between "continuing records", as used in this report, and "continuous recordings," which refers to a continuous graph or a series of discrete values logged at short intervals by electronic data loggers. Some records of water quality, such as temperature and specific conductance, may be obtained through continuous recordings; however, because of costs, most data are obtained only monthly or less frequently.

Arrangement of Records

Water-quality records collected at a surface-water daily record station are published immediately following that record, regardless of the frequency of sample collection. Station number and name are the same for both records. Where a surface-water daily record station is not available or where the water quality differs significantly from that at the nearby surface-water station, the continuing water-quality record is published with its own station number and name in the regular downstream-order sequence. Water-quality data for partial-record stations and for miscellaneous sampling sites

which are not at a surface-water daily record station appear in separate tables following the table of discharge measurements at miscellaneous sites.

On-site Measurements and Sample Collection

Water-quality data must represent the in-situ quality of the water. To assure this, certain measurements, such as water temperature, pH, and dissolved oxygen, must be made on-site when the samples are collected. In addition, specific procedures must be used in collecting, treating, and shipping the samples to the laboratory. Procedures for on site measurements and for collecting, treating, and shipping samples are given in publications on "Techniques of Water-Resources Investigations," Book 1, Chap. D2; Book 3, Chap. C2; Book 5, Chap. A1, A3, and A4; Book 9, Chap. A1-A9. These references are listed under "PUBLICATIONS ON TECHNIQUES OF WATER-RESOURCES INVESTIGATIONS" section of this report. These methods are consistent with ASTM standards and generally follow ISO standards.

In streams, concentrations of various constituents may vary within the cross section depending on variables such as flow rate, the sources of the constituents, and mixing. Generally, constituents in solid phases are more variable in the cross section than are dissolved constituents. In many cases, samples must integrate several parts of the stream cross section to be representative, especially if loads will be calculated. One sample may be representative of the cross section when the distribution of constituents is homogeneous. All samples are obtained from multiple verticals.

Chemical-quality data published in this report are considered to be the most representative values available for the stations listed. In some instances, apparent inconsistencies may exist in the data. For example, the orthophosphate-phosphorus concentration may exceed total phosphorus concentration. However, the difference in the inconsistent values normally is smaller than the precision of the analytical techniques. Inconsistencies between pH and carbonate and bicarbonate concentrations are commonly caused by intake or loss of carbon dioxide by the sample before it can be analyzed.

For chemical-quality stations equipped with digital monitors, the records consist of daily maximum, minimum, and mean values for each constituent measured and are based upon hourly recordings beginning at 0100 hours and ending at 2400 hours for the day of record. More detailed records (hourly values) may be obtained from the U.S. Geological Survey, New Jersey District Office whose address is given on the back of the title page of this report.

Water Temperature

Water temperatures are measured at most of the water-quality stations. In addition, water temperatures are taken at time of discharge measurements for water-discharge stations. Large streams have a small diurnal temperature change; shallow streams may have a daily range of several degrees and may follow closely the changes in air temperature. Some streams may be affected by waste-heat discharges.

At stations where recording instruments are used, maxi-

mum, minimum and mean temperatures for each day are published. Water temperatures measured at the time of water-discharge measurements are on file in the New Jersey District Office.

Sediment

Suspended-sediment concentrations are determined from samples collected by using depth-integrating samplers. Samples usually are obtained at several verticals in the cross section, or a single sample may be obtained at a fixed point and a coefficient applied to determine the mean concentration in the cross sections.

At other stations, suspended-sediment samples were collected periodically at many verticals in the stream cross section. Although data collected periodically may represent conditions only at the time of observations, such data are useful in establishing seasonal relations between quality and streamflow and in predicting long-term sediment-discharge characteristics of the stream.

In addition to the records of suspended-sediment discharge, records of the periodic measurements of the particle-size distribution of the suspended sediment and bed material are included for some stations.

Laboratory Measurements

Samples for biochemical-oxygen demand, fecal coliform and enterococcus bacteria, and hexavalent chromium are analyzed at the New Jersey Department of Health, Public Health and Environmental Laboratories. Samples for nutrients are analyzed at the New Jersey Department of Health or at the U.S. Geological Survey Laboratory in Arvada, Colorado. Sediment samples--parameter codes, 80154, 80157, and 80164--are analyzed in the U.S. Geological Survey Laboratories in Iowa City, Iowa. All other samples are analyzed in the U.S. Geological Survey laboratory in Arvada, Colorado. Methods used in analyzing sediment samples and computing sediment records are given in TWRI, Book 5, Chap. C1. Methods used by the U.S. Geological Survey laboratory are given in TWRI, Book 1, Chap. D2; Book 3, Chap. C2; Book 5, Chap. A1, A3, A4, and A5. These methods are consistent with ASTM standards and generally follow ISO standards.

Analyses of pesticides in surface-water and ground-water samples (schedule 2001)

Selected water samples from ASMN, AGWQN, and DELR-NAWQA study sites were analyzed for pesticides on schedule 2001 during the 2000 water year. This table lists the pesticides on the schedule, the unit of measure (micrograms per liter, $\mu\text{g/L}$), the U.S. Geological Survey National Water Information System parameter code, and the reporting level. **Only pesticides measured at or above the minimum reporting level for one or more samples are listed in the water-quality tables.**

SCHEDULE DESCRIPTION.--Pesticides in filtered water extracted on C-18 Solid Phase Extraction (SPE) cartridge and analyzed by Gas Chromatography/Mass Spectrometry (GC/MS).

SAMPLE REQUIREMENTS.--1 liter of water filtered through 0.7-micron glass-fiber depth filter, chilled at 4° C (packed in ice).

CONTAINER REQUIREMENTS.--1 liter baked amber glass bottle (GCC) from NWQL.

PCODE.--The USGS/EPA parameter code.

COMMON NAME.--Common or trade name(s) for constituent

LRL.--Laboratory reporting level.

PCode	Common Name	LRL (µg/L)
82660	2,6-Diethylaniline	0.003
49260	Acetochlor	0.002
46342	Alachlor	0.002
34253	alpha-HCH	0.002
39632	Atrazine	0.001
82673	Benfluralin	0.002

Analyses of volatile organic compounds in surface-water and ground-water samples (schedule 2020/2021)

Selected surface water samples from ASMN and DELR-NAWQA study sites and selected ground-water samples from ambient monitoring network sites were analyzed for volatile organic compounds (VOCs) in 2000. The National Water Quality Lab (NWQL) created a method for accurate determination of VOCs in water in the nanogram per liter range, schedules 2020/2021. The method described in USGS Open-File Report 97-829 (Connor and others) is similar to USEPA method 524-2 (Mund, 1995) and the method described by Rose and Schroeder (1995). Minor improvements to instrument operating conditions include the following: additional compounds, quantitation ions that are different from those recommended in USEPA Method 524.2 because of interferences from the additional compounds, and a data reporting strategy for measuring detected compounds extrapolated at less than the lowest calibration standard or measured at less than the reporting limit. The laboratory reporting limit (LRL) is introduced as a statistically defined reporting limit designed to limit false positives and false negatives to less than 1 percent.

This table lists the volatile organic compounds on the schedule, the unit of measure (micrograms per liter (µg/L), the U.S. Geological Survey National Water Information System parameter code, the Union of Pure and Applied Chemistry (IUPAC) compound name, and the National Water Quality Laboratory compound name. Positive detections measured at less than LRL but greater than or equal to the long-term method-detection limit are reported as estimated concentrations (E) to alert the data user to decreased confidence in accurate quantitation. Values for analytes in the 2020/2021 schedules are preceded by an "E" in the following situations:

1. When the calculated concentration is less than the lowest calibration standard. The analyte meets all identification criteria to be positively identified, but the amount detected is below where it can be reliably quantified.
2. If a sample is diluted for any reason. The method reporting level is multiplied by the dilution factor to obtain the adjusted method reporting level. Values below the lowest calibration standard, multiplied by the dilution factor are qualified with an "E". For example, a value of 0.19 in a 1:2 dilution is reported as E0.1.
3. If the set spike has recoveries out of the specified range (60-140%).
4. If the analyte is also detected in the set blank. If the value in the sample is less than five times the blank value and greater than the blank value plus the long term method detection limit, the value is preceded by an "E" to indicate that the analyte is positively identified but not positively quantified because the analyte was also detected in the blank.

Only VOCs measured at or above the minimum

reporting level for one or more samples are listed in the water-quality tables.

SCHEDULE DESCRIPTION.--The sample water is actively purged with helium to extract the volatile organic compounds. The volatile compounds are trapped onto a sorbent trap, thermally desorbed, separated by a megabore gas chromatographic capillary column, and finally determined by a full scan quadrupole mass spectrometer. Compound identification is confirmed by the gas chromatographic retention time and by the resultant mass spectrum, typically identified by three unique ions.

SAMPLE REQUIREMENTS.--Water collected in vials placed in stainless steel VOC sampler. Hydrochloric acid is used for preservation. Chilled at 4°C (packed in ice).

CONTAINER REQUIREMENTS.--40 milliliter baked amber septum glass vial, from OCALA Quality Water Service Unit.

PCODE.--The EPA/USGS parameter code

COMPOUND NAME.--IUPAC nomenclature

LRL.--Laboratory reporting level

Polyaromatic hydrocarbons in stream bottom material

Stream bed sediments collected at stations in the Ambient Stream Monitoring Program were analyzed for polyaromatic hydrocarbons during the months of August and September. Full parameter names are listed in the table below, abbreviated parameter names are used in the station records.

WATER RESOURCES DATA - NEW JERSEY, 2000

PCode	Compound Name
39519	TOTAL POLYCHLORINATED BYPHENYLS
49429	ACENAPHTHENE

49489	Hexachlorocyclopentadiene
49948	2-Ethyl-naphthalene

Methylene blue active substances

MBAS determinations made from January 1, 1970 through August 29, 1993, at the National Water Quality Laboratory in Denver (Analyzing Agency Code 80020) are positively biased. These data can be corrected by using the following equation, if concentrations of dissolved nitrate plus nitrite, as nitrogen, and dissolved chloride, determined concurrently with the MBAS data, are applied:

$$\text{MBASCOR} = \text{M} - 0.0088\text{N} - 0.00019\text{C}$$

where:

- MBASCOR = corrected MBAS concentration, in mg/L;
- M = reported MBAS concentration, in mg/L;
- N = dissolved nitrate plus nitrite, as nitrogen, concentration, in mg/L; and
- C = dissolved chloride concentration, in mg/L.

The detection limit of the new method is 0.02 mg/L, whereas the detection limit for the old method was 0.01 mg/L. A detection limit of 0.02 mg/L should be used with corrected MBAS data from January 1, 1970 through August 29, 1993.

Analysis of acid neutralizing capacity (ANC)

Prior to October 1, 1996, ANC was called ALKALINITY, LAB.

Analysis of inorganic carbon in bottom material

Prior to October 1996, the analysis of total inorganic carbon in bottom material by the National Water Quality Laboratory (NWQL) was subject to a systematic positive

bias of 3 percent. That is, results calculated before this date were found to be about 3 percent higher than results calculated correctly with a new computer system. The average agreement between analysis results for duplicate samples (a measure of the NWQL's precision for this analysis) is 98 percent. The 3-percent bias, therefore, approximates the precision of the analytical method. The overall effect on historical data from New Jersey is minor. Ninety-three percent of the reported concentrations for this analysis were less than 1.7 grams per kilogram; values of this magnitude are unaffected because the difference is obscured by rounding prior to publication of the analysis results. The magnitude of the error is such that the 3 percent difference, effective October 1, 1996, is indiscernible in the relatively small data set for any station.

Data Presentation

Precision varies for different analytical methods used to determine the same constituent. The presence of trailing zeros after the decimal in values printed in this report does not necessarily indicate that the method used for the determination is as precise as the level implied by the rightmost zero.

The column headings for water-quality constituents include 5-digit EPA Storet parameter codes. The codes are included to permit accurate cross reference to data from other data bases using the same code system.

For continuing-record stations, information pertinent to the history of station operation is provided in descriptive headings preceding the tabular data. These descriptive headings give details regarding location, drainage area, period of record, type of data available, instrumentation, general remarks, cooperation, and extremes for parameters currently measured daily. Tables of chemical, physical, biological, radiochemical data, obtained at a frequency less than daily are presented first. Tables of "daily values" of specific conductance, pH, water temperature, and dissolved oxygen, then follow in sequence.

Station manuscript

The following information, as appropriate, is provided with each continuous-record station. Comments that follow clarify information presented under the various headings of the station description.

LOCATION.--Information on locations is obtained from the most accurate maps available. The location of the station with respect to the cultural and physical features in the vicinity and with respect to the reference place.

DRAINAGE AREA.--Drainage areas are measured using the most accurate maps available. Because the type of maps available varies from one drainage basin to another, the accuracy of drainage areas likewise varies. Drainage areas are updated as better maps become available.

PERIOD OF RECORD.--This indicates the periods for which there are published water-quality records for the station. The periods are shown separately for records of parameters measured daily or continuously and those measured less than daily. For those measured daily or continuously,

periods of record are given for the parameters individually.

INSTRUMENTATION.--Information on instrumentation is given only if a water-quality monitor, temperature recorder, sediment pumping sampler, or other sampling device is in operation at a station.

REMARKS.--Remarks provide added information pertinent to the collection, analysis, or computation of the records.

COOPERATION.--Records provided by a cooperating organization or obtained for the U.S. Geological Survey by a cooperating organization are identified here.

EXTREMES.--Maximums and minimums are given only for parameters measured daily or more frequently. None are given for parameters measured weekly or less frequently, because the true maximums or minimums may not have been sampled. Extremes, when given, are provided for both the period of record and for the current water year.

REVISIONS.--If errors in published water-quality records are discovered after publication, appropriate updates are made to the Water-Quality File in the U.S. Geological Survey's computerized data system, NWIS, and subsequently by monthly transfer of update transactions to the U.S. Environmental Protection Agency's STORET system. Because the usual volume of updates makes it impractical to document individual changes in the State data-report series or elsewhere, potential users of U.S. Geological Survey water-quality data are encouraged to obtain all required data from the appropriate computer file to insure the most recent updates.

The surface-water-quality records for partial-record stations and miscellaneous sampling sites which are not at a surface-water daily record station are published in separate tables following the continuous record data. No descriptive statements are given for these records. Each station is published with its own station number and name in the regular downstream-order sequence.

Remark codes

The following remark codes may appear with the water-quality data in this report:

PRINTED OUTPUT

<u>REMARK</u>	
E	Estimated value.
>	Actual value is known to be greater than the value shown.
<	Actual value is known to be less than the value shown.
M	Presence of material verified but not quantified.
K	Results based on colony count outside the acceptance range (non-ideal colony count).
L	Biological organism count less than 0.5 percent

(organism may be observed rather than counted).

- D Biological organism count equal to or greater than 15 percent (dominant).
- & Biological organism estimated as dominant.
- V Analyte was detected in both the environmental sample and the associated blanks.

Quality-control data

Data generated from quality-control (QC) samples are a requisite for evaluating the quality of the sampling and processing techniques as well as data from the actual samples themselves. Without QC data, environmental sample data cannot be adequately interpreted because the errors associated with the sample data are unknown. The various types of QC samples collected by this District are described in the following section. Procedures have been established for the storage of water-quality-control data within the USGS. These procedures allow for storage of all derived QC data and are identified so that they can be related to corresponding environmental samples.

BLANK SAMPLES.--Blank samples are collected and analyzed to ensure that environmental samples have not been contaminated by the overall data-collection process. The blank solution used to develop specific types of blank samples is a solution that is free of the analytes of interest. Any measured value signal in a blank sample for an analyte (a specific component measured in a chemical analysis) that was absent in the blank solution is believed to be due to contamination. There are many types of blank samples possible, each designed to segregate a different part of the overall data-collection process. The types of blank samples collected in this District are:

Source solution blank - a blank solution that is transferred to a sample bottle in an area of the office laboratory with an atmosphere that is relatively clean and protected with respect to target analytes.

Ambient blank - a blank solution that is put in the same type of bottle used for an environmental sample, kept with the set of sample bottles before sample collection, and opened at the site and exposed to the ambient conditions.

Field blank - a blank solution that is subjected to all aspects of sample collection, field processing preservation, transportation, and laboratory handling as an environmental sample.

Trip blank - a blank solution that is put in the same type of bottle used for an environmental sample and kept with the set of sample bottles before and after sample collection.

Equipment blank - a blank solution that is processed through all equipment used for collecting and processing an environmental sample (similar to a field blank but normally done in the more controlled conditions of the office).

Sampler blank - a blank solution that is poured or pumped through the same field sampler used for collecting an environmental sample.

Pump blank - a blank solution that is processed through the same pump-and-tubing system used for an environmental sample.

Standpipe blank - a blank solution that is poured from the containment vessel (standpipe) before the pump is inserted to obtain the pump blank.

Filter blank - a blank solution that is filtered in the same manner and through the same filter apparatus used for an environmental sample.

Splitter blank - a blank solution that is mixed and separated using a field splitter in the same manner and through the same apparatus used for an environmental sample.

Preservation blank - a blank solution that is treated with the sampler preservatives used for an environmental sample.

Cannister blank - a blank solution that is taken directly from a stainless steel cannister just before the VOC sampler is submerged to obtain a field blank sample.

REFERENCE SAMPLES.--Reference material is a solution or material prepared by a laboratory whose composition is certified for one or more properties so that it can be used to assess a measurement method. Samples of reference material are submitted for analysis to ensure that an analytical method is accurate for the known properties of the reference material. Generally, the selected reference material properties are similar to the environmental sample properties.

REPLICATE SAMPLES.--Replicate samples are a set of environmental samples collected in a manner such that the samples are thought to be essentially identical in composition. Replicate is the general case for which a duplicate is the special case consisting of two samples. Replicate samples are collected and analyzed to establish the amount of variability in the data contributed by some part of the collection and analytical process. There are many types of replicate samples possible, each of which may yield slightly different results in a dynamic hydrologic setting, such as a flowing stream. The types of replicate samples collected in this District are:

Concurrent sample - a type of replicate sample in which the samples are collected simultaneously with two or more samplers or by using one sampler and alternating collection of samples into two or more compositing containers.

Sequential sample - a type of replicate sample in which the samples are collected one after the other, typically over a short time.

Split sample - a type of replicate sample in which a sample is split into subsamples contemporaneous in time and space.

SPIKE SAMPLES.--Spike samples are samples to which known quantities of a solution with one or more well-established analyte concentrations have been added. These samples are analyzed to determine the extent of matrix interference or degradation on the analyte concentration during sample processing and analysis.

Concurrent sample - a type of spike sample that is collected at the same time with the same sampling and compositing devices then spiked with the same spike solution containing laboratory-certified concentrations of selected analytes.

Split sample - a type of spike sample in which a sample is split into subsamples contemporaneous in time and space then spiked with the same spike solution containing laboratory-certified concentrations of selected analytes.

Dissolved Trace-Element Concentrations

Note.--Traditionally, dissolved trace-element concentrations have been reported at the microgram per liter ($\mu\text{g/L}$) level. Recent evidence, mostly from large rivers, indicates that actual dissolved-phase concentrations for a number of trace elements are within the range of 10's and 100's of nanograms per liter (ng/L). Data above the $\mu\text{g/L}$ level should be viewed with caution. Such data may actually represent elevated environmental concentrations from natural or human causes; however, these data could reflect contamination introduced during sampling, processing, or analysis. To confidently produce dissolved trace-element data with insignificant contamination, the U.S. Geological Survey began using new trace-element protocols in water year 1994. Full implementation of the protocols took place during the 1995 water year.

CURRENT WATER RESOURCES PROJECTS IN NEW JERSEY

The Geological Survey is currently involved in a number of hydrologic investigations in the State of New Jersey. The following is a list of these investigations. Results are published at the conclusion of short-term projects or periodically in the case of long-term projects. Hydrologic data from these projects are entered into the NWIS data base.

Barnegat Bay Non-Point Source

Characterization of the Water Quality of the Delaware and Raritan Canal

Compositional Modeling of Organic Transport and Biodegradation of Organic Compounds in the Unsaturated Zone and Ground Water

Delaware River Basin National Water Quality Assessment

Development of Database and Models to Support Source Water Assessment Program

- Distribution of MTBE and Related VOC Compounds in Lakes in Northern NJ and Investigation of Lake-Well Interactions
- Distribution of Radium and Related Radionuclides in Coastal-Plain Aquifers
- EPA Technical Assistance Program
- Estimation of the Relative Importance of Nonpoint Source Loads in the Raritan River Basin
- Flood Characteristics of New Jersey Streams
- Geohydrology of the Naval Air Warfare Center, West Trenton, New Jersey
- Ground-Water Data Collection Network
- Ground-Water Levels and Chloride Concentrations in Major Aquifers of the Coastal Plain
- Ground-Water Supply Availability in the Northern Passaic Basin
- High-Flow Water Quality Management Objectives
- Hydrology of Surficial Aquifer Systems
- Hydrogeologic Support to Fort Dix, Burlington County, New Jersey
- Hydrogeologic Support to McGuire A.F.B., Burlington County, New Jersey
- Hydrogeologic Support to Picatinny Arsenal, Morris County, New Jersey
- Investigation of Contaminant Transport in a Fractured Rock Aquifer, Rutgers University, Busch Campus
- Investigation of GW-SW Interaction in the Northern Passaic River Valley, New Jersey
- Investigation of hydrogeology and VOC Contamination in Fair Lawn, New Jersey
- Investigation of Potential Threats to Water Supply from the PRM Aquifer in Salem and Western Gloucester Counties, New Jersey
- Investigation of Water Quality in the Wanaque South Diversion Area, Morris and Passaic Counties, New Jersey
- Low Flow Characteristics of New Jersey Streams
- Modeling and Experimental Investigation of Hydrocarbon Transport and Biodegradation in the Unsaturated Zone
- Model of the Manasquan Water Supply System
- Movement of Chromium in the Ground Water of Pennsauken Township, Camden County
- Multispecies Transport in Ground Water
- New Jersey-Long Island National Water Quality Assessment
- New Jersey Tide Telemetry System
- Pascack Brook Flood Warning System
- Passaic Flood Warning System
- Program to Maintain and Update Ground-Water Models to Evaluate Continued Water-Supply Development
- Quality of Water Data Collection Network
- Rahway Flood Warning System
- Reconstruction of Natural Streamflow Records, Passaic and Hackensack River Basins
- Small-Scale Watershed Delineation for GIS (14-Digit Hydrologic Unit Codes)
- Small Watershed Flood Data Collection
- Somerset County Flood-Information System
- Strategic Environmental Research Development Program, Biodegradation, Picatinny Arsenal
- Surface Water Data Collection Network
- Vulnerability Assessment of the Kirkwood-Cohansey Aquifer System to Radium, Mercury, and Trace Metals
- Vulnerability of Public Supply Wells and Surface-Water Intakes in New Jersey for Chemicals of Concern (Source Water Assessment Program)

ACCESS TO USGS WATER DATA

The U.S. Geological Survey provides near real-time stage and discharge data for many of the gaging stations equipped with the necessary telemetry and historic daily-mean and peak-flow discharge data for most current or discontinued gaging stations through the world wide web (WWW). These data may be accessed at

<http://water.usgs.gov>

Some water-quality and ground-water data also are available through the WWW. In addition, data can be provided in various machine-readable formats on magnetic tape or 3-1/2 inch floppy disk. Information about the avail-

ability of specific types of data or products, and user charges, can be obtained locally from each of the Water Resources Division District Offices (see address on the back of the title page).

DEFINITION OF TERMS

Terms related to streamflow, water-quality, and other hydrologic data, as used in this report, are defined below. See also table for converting English units to International System (SI) Units on the inside of the back cover.

Acid neutralizing capacity (ANC) is the equivalent sum of all bases or base-producing materials, solutes plus particulates, in an aqueous system that can be titrated with acid to an equivalence point. This term designates titration of an "unfiltered" sample (formerly reported as alkalinity).

Acre-foot (AC-FT, acre-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equivalent to 43,560 cubic feet, 325,851 gallons, or 1,233 cubic meters.

Adenosine triphosphate (ATP) is an organic, phosphate-rich, compound important in the transfer of energy in organisms. Its central role in living cells makes it an excellent indicator of the presence of living material in water. A measurement of ATP therefore provides a sensitive and rapid estimate of biomass. ATP is reported in micrograms per liter.

Algae are mostly aquatic single-celled, colonial, or multicelled plants containing chlorophyll and lacking roots, stems, and leaves.

Algal growth potential (AGP) is the maximum algal dry weight biomass that can be produced in a natural water sample under standardized laboratory conditions. The growth potential is the algal biomass present at stationary phase and is expressed as milligrams dry weight of algae produced per liter of sample.

Alkalinity is the capacity of solutes in an aqueous system to neutralize acid. This term designates titration of a "filtered" sample.

Annual runoff is the total quantity of water in runoff for a drainage area for the year. Data reports may use any of the following units of measurement in presenting annual runoff data:

Acre-foot (AC-FT, acre-ft) is the quantity of water required to cover 1 acre to a depth of 1 foot and is equal to 43,560 cubic feet, 325,851 gallons, or 1,233 cubic meters

Cubic foot per second per square mile [CFSM, (ft³/s)/mi²] is the average number of cubic feet of water flowing per second from each square mile of area drained, assuming the runoff is distributed uniformly in time and area.

Inch (IN., in.) as used in this report, refers to the depth to which the drainage area would be covered with water if all of the runoff for a given time period were uniformly distributed on it.

Aroclor is the registered trademark for a group of polychlorinated biphenyls that were manufactured by the Monsanto Company prior to 1976. Aroclors are assigned specific 4-digit reference numbers dependent upon molecular type and degree of substitution of the biphenyl ring hydrogen

atoms by chlorine atoms. The first two digits of a numbered aroclor represent the molecular type and the last two digits represent the weight percent of the hydrogen substituted chlorine.

Bacteria are microscopic unicellular organisms, typically spherical, rodlike, or spiral and threadlike in shape, often clumped into colonies. Some bacteria cause disease, while others perform an essential role in nature in the recycling of materials; for example, by decomposing organic matter into a form available for reuse by plants.

Total coliform bacteria are a particular group of bacteria that are used as indicators of possible sewage pollution. This group includes coliforms that inhabit the intestine of warm-blooded animals and those that inhabit soils. They are characterized as aerobic or facultative anaerobic, gram-negative, nonspore-forming, rod-shaped bacteria that ferment lactose with gas formation within 48 hours at 35 °C. In the laboratory, these bacteria are defined as all the organisms that produce colonies with a golden-green metallic sheen within 24 hours when incubated at 35 °C plus or minus 1.0 °C on M-Endo medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Fecal coliform bacteria are bacteria that are present in the intestine or feces of warm-blooded animals. They are often used as indicators of the sanitary quality of the water. In the laboratory, they are defined as all organisms that produce blue colonies within 24 hours when incubated at 44.5 °C plus or minus 0.2 °C on M-FC medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Fecal streptococcal bacteria are bacteria found in the intestine of warm-blooded animals. Their presence in water is considered to verify fecal pollution. They are characterized as gram-positive, cocci bacteria that are capable of growth in brain-heart infusion broth. In the laboratory, they are defined as all the organisms that produce red or pink colonies within 48 hours at 35 °C plus or minus 1.0 °C on KF-streptococcus medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Enterococcus bacteria are commonly found in the feces of humans and other warm-blooded animals. Although some strains are ubiquitous and not related to fecal pollution, the presence of enterococci in water is an indication of fecal pollution and the possible presence of enteric pathogens. Enterococcus bacteria are those bacteria that produce pink to red colonies with black or reddish-brown precipitate after incubation at 41 °C on mE agar and subsequent transfer to EIA medium. Enterococci include *Streptococcus faecalis*, *Streptococcus faecium*, *Streptococcus avium*, and their variants.

Escherichia coli (E. coli) are bacteria present in the intestine and feces of warm-blooded animals. *E. coli* are a member species of the fecal coliform group of indicator bacteria. In the laboratory, they are defined as those bacteria that produce yellow or yellow-brown colonies on a filter pad saturated with urea substrate broth after primary culturing for 22 to 24 hours at 44.5 °C on

mTEC medium. Their concentrations are expressed as number of colonies per 100 mL of sample.

Base flow is flow in a channel sustained by groundwater discharge in the absence of direct runoff.

Bedload is the sediment which moves along in essentially continuous contact with the streambed by rolling, sliding, and making brief excursions into the flow a few diameters above the bed.

Bed material is the sediment mixture of which a streambed, lake, pond, reservoir, or estuary bottom is composed.

Benthic organisms (invertebrates) are the group of animals inhabiting the bottom of an aquatic environment. They include a number of types of organisms, such as bacteria, fungi, insect larvae and nymphs, snails, clams, and crayfish. They are useful as indicators of water quality.

Biochemical oxygen demand (BOD) is a measure of the quantity of dissolved oxygen, in milligrams per liter, necessary for the decomposition of organic matter by microorganisms, such as bacteria.

Biomass is the amount of living matter present at any given time, expressed as mass per unit area or volume of habitat.

Ash mass is the mass or amount of residue present after the residue from the dry mass determination has been ashed in a muffle furnace at a temperature of 500 °C for 1 hour. Ash mass of zooplankton and phytoplankton is expressed in grams per cubic meter (g/m^3), and periphyton and benthic organisms in grams per square meter (g/m^2).

Dry mass refers to the mass of residue present after drying in an oven at 105 °C for zooplankton and periphyton, until the mass remains unchanged. This mass represents the total organic matter, ash, and sediment in the sample. Dry mass is expressed in the same units as ash mass.

Organic mass or volatile mass of the living substance is the difference between the dry mass and ash mass and represents the actual mass of the living matter. Organic mass is expressed in the same units as for ash mass and dry mass.

Wet mass is the mass of living matter plus contained water.

Biomass pigment ratio is an indicator of the total proportion of periphyton which are autotrophic (plants). This is also called the Autotrophic Index.

Bottom material: See "Bed material."

Cells/volume refers to the number of plankton cells or natural units counted using a microscope and grid or counting cell. Results are generally reported as cells or units per milliliter.

Cells volume (biovolume) determination is one of several common methods used to estimate biomass of algae in aquatic systems. Cell members of algae are frequently used in aquatic surveys as an indicator of algal production. However, cell numbers alone cannot represent true biomass because of considerable cell-size variation among the algal species. Cell volume (μm^3) is determined by obtaining criti-

cal cell measurements on cell dimensions (for example, length, width, height, or radius) for 20 to 50 cells of each important species to obtain an average biovolume per cell. Cells are categorized according to the correspondence of their cellular shape to the nearest geometric solid or combinations of simple solids (for example, spheres, cones, or cylinders). Representative formulae used to compute biovolume are as follows:

sphere $\frac{4}{3} \pi r^3$ cone $\frac{1}{3} \pi r^2 h$ cylinder $\pi r^2 h$.

From cell volume, total algal biomass expressed as biovolume ($\mu m^3/mL$) is thus determined by multiplying the number of cells of a given species by its average cell volume and then summing these volumes over all species.

Chemical oxygen demand (COD) is a measure of the chemically oxidizable material in the water and furnishes an approximation of the amount of organic and reducing material present. The determined value may correlate with BOD or with carbonaceous organic pollution from sewage or industrial wastes.

Chlorophyll refers to the green pigments of plants. Chlorophyll a and b are the two most common green pigments in plants.

Colloid is any substance with particles in such a fine state of subdivision dispersed in a medium (for example, water) that they do not settle out; but not in so fine a state of subdivision that they can be said to be truly dissolved.

Color unit is produced by 1 milligram per liter of platinum in the form of the chloroplatinate ion. Color is expressed in units of the platinum-cobalt scale.

Confined aquifer is a term used to describe an aquifer containing water between two relatively impermeable boundaries. The water level in a well tapping a confined aquifer stands above the top of the confined aquifer and can be higher or lower than the water table that may be present in the material above it. In some cases the water level can rise above the ground surface, yielding a flowing well.

Contents is the volume of water in a reservoir or lake. Unless otherwise indicated, volume is computed on the basis of a level pool and does not include bank storage.

Continuous-record station is a site that meets either of the following conditions:

1. Stage or streamflow are recorded at some interval on a continuous basis. The recording interval is usually 15 minutes, but may be less or more frequent.
2. Water-quality, sediment, or other hydrologic measurements are recorded at least daily.

Control designates a feature in the channel downstream from a gaging station that physically influences the water-surface elevation and thereby determines the stage-discharge relation at the station. This feature may be a constriction of the channel, a bedrock outcrop, a gravel bar, an artificial structure, or a uniform cross section over a long reach of the channel.

Control structure as used in this report is a structure on a stream or canal that is used to regulate the flow or stage of the stream or to prevent the intrusion of saltwater.

Cubic foot per second (CFS, ft^3/s) is the rate of discharge representing a volume of 1 cubic foot passing a given

point in 1 second. It is equivalent to approximately 7.48 gallons per second, 448.8 gallons per minute, or 0.02832 cubic meters per second.

Cubic foot per second-day (CFS-DAY, Cfs-day, [(ft³/s)/d]) is the volume of water represented by a flow of 1 cubic foot per second for 24 hours. It is equivalent to 86,400 cubic feet, 1.9835 acre-feet, 646,317 gallons, or 2,447 cubic meters.

Daily record is a summary of streamflow, sediment, or water-quality values computed from data collected with sufficient frequency to obtain reliable estimates of daily mean values.

Daily record station is a site for which daily records of streamflow, sediment, or water-quality values are computed.

Datum, as used in this report, is an elevation above mean sea level to which all gage height readings are referenced.

Diel is of or pertaining to a 24-hour period of time; a regular daily cycle.

Discharge, or flow, is the volume of water (or more broadly, volume of fluid including solid- and dissolved-phase material), that passes a given point in a given period of time.

Annual 7-day minimum is the lowest mean discharge for 7 consecutive days in a year. Note that most low-flow frequency analyses of annual 7-day minimum flows use a climatic year (April 1-March 31). The date shown in the summary statistics table is the initial date of the 7-day period. (This value should not be confused with the 7-day 10-year low-flow statistic.)

Instantaneous discharge is the discharge at a particular instant of time.

Mean discharge (MEAN) is the arithmetic mean of individual daily mean discharges during a specific period.

Dissolved refers to that material in a representative water sample that passes through a 0.45-micrometer membrane filter. This is a convenient operational definition used by Federal agencies that collect water data. Determinations of "dissolved" constituents are made on subsamples of the filtrate.

Dissolved oxygen (DO) content of water in equilibrium with air is a function of atmospheric pressure, temperature, and dissolved-solids concentration of the water. The ability of water to retain oxygen decreases with increasing temperature or dissolved solids, with small temperature changes having the more significant offset. Photosynthesis and respiration may cause diurnal variations in dissolved-oxygen concentration in water from some streams.

Dissolved-solids concentration of water is determined either analytically by the "residue-on-evaporation" method, or mathematically by totaling the concentrations of individual constituents reported in a comprehensive chemical analysis. During that analytical determination of dissolved solids, the bicarbonate (generally a major dissolved component of water) is converted to carbonate. Therefore, in the mathematical calculation of dissolved-solids concentration, the bicarbonate value, in milligrams per liter, is multiplied by 0.4926

to reflect the change. Alternatively, alkalinity concentration (as mg/L CaCO₃) can be converted to carbonate concentration by multiplying by 0.60.

Diversity index is a numerical expression of evenness of distribution of aquatic organisms. The formula for diversity index is:

$$= - \sum_{i \approx 1}^s \frac{n_i}{n} \log_2 \frac{n_i}{n}$$

where n_i is the number of individuals per taxon, n is the total number of individuals, and s is the total number of taxa in the sample of the community. Diversity index values range from zero, when all the organisms in the sample are the same, to some positive number, when some or all of the organisms in the sample are different.

Drainage area of a site on a stream is that area, measured in a horizontal plane, that has a common outlet at the site for its surface runoff. Figures of drainage area given herein include all closed basins, or noncontributing areas, within the area unless otherwise specified.

Drainage basin is a part of the Earth's surface that is occupied by a drainage system with a common outlet for its surface runoff (see "Drainage area").

Dry weight refers to the weight of animal tissue after it has been dried in an oven at 65 °C until a constant weight is achieved. Dry weight represents total organic and inorganic matter in the tissue.

Flow-duration percentiles are values on a scale of 100 that indicate the percentage of time for which a flow is not exceeded. For example, the 90th percentile of river flow is greater than or equal to 90 percent of all recorded flow rates.

Gage datum is the elevation of the zero point of the reference gage from which gage height is determined as compared to sea level (see "Datum"). This elevation is established by a system of levels from known benchmarks, by approximation from topographic maps, or by geographical positioning system.

Gage height (G.H.) is the water-surface elevation referenced to the gage datum. Gage height is often used interchangeably with the more general term "stage," although gage height is more appropriate when used with a reading on a gage.

Gaging station is a site on a stream, canal, lake, or reservoir where systematic observations of stage, discharge, or other hydrologic data are obtained. When used in connection with a discharge record, the term is applied only to those gaging stations where a continuous record of discharge is computed.

Gas chromatography/flame ionization detector (GC/FID) is a laboratory analytical method used as a screening technique for semivolatile organic compounds that are extractable from water in methylene chloride.

Ground-water level is the elevation of the water table or another potentiometric surface at a particular location.

Hardness of water is a physical-chemical characteristic that is commonly recognized by the increased quantity of soap required to produce lather. It is attributable to the pres

ence of alkaline earths (principally calcium and magnesium) and is expressed as the equivalent concentration of calcium carbonate (CaCO_3).

High tide is the maximum height reached by each rising tide. The high-high and low-high tides are the higher and lower of the two high tides, respectively, of each tidal day.

See NOAA web site:

<http://www.co-ops.nos.noaa.gov/tideglos.html>

Hydrologic benchmark station is one that provides hydrologic data for a basin in which the hydrologic regimen will likely be governed solely by natural conditions. Data collected at a benchmark station may be used to separate effects of natural from human-induced changes in other basins that have been developed and in which the physiography, climate, and geology are similar to those in the undeveloped benchmark basin.

Hydrologic unit is a geographic area representing part or all of a surface drainage basin or distinct hydrologic feature as defined by the former Office of Water Data Coordination and delineated on the State Hydrologic Unit Maps by the U.S. Geological Survey. Each hydrologic unit is identified by an 8-digit number.

Land-surface datum (lsd) is a datum plane that is approximately at land surface at each ground-water observation well.

Light-attenuation coefficient, also known as the extinction coefficient, is a measure of water clarity. Light is attenuated according to the Lambert-Beer equation

$$I = I_0 e^{-\lambda L}$$

where I_0 is the source light intensity, I is the light intensity at length L (in meters) from the source, λ is the light-attenuation coefficient, and e is the base of the natural logarithm. The light attenuation coefficient is defined as

$$K = -\frac{1}{L} \log e \frac{I}{I_0}$$

Lipid is any one of a family of compounds that are insoluble in water and that make up one of the principal components of living cells. Lipids include fats, oils, waxes, and steroids. Many environmental contaminants such as organochlorine pesticides are lipophilic.

Low tide is the minimum height reached by each falling tide. The high-low and low-low tides are the higher and lower of the two low tides, respectively, of each tidal day.

See NOAA web site:

<http://www.co-ops.nos.noaa.gov/tideglos.html>

Laboratory Reporting Level (LRL) is generally equal to twice the yearly determined long term method detection level (LT-MDL). The LRL controls false negative error. The probability of falsely reporting a non-detection for a sample that contained an analyte at a concentration equal to or greater than the LRL is predicted to be less than or equal to 1 percent. The value of the LRL will be reported with a "less than" remark code for samples in which the analyte was not detected. The National Water Quality Laboratory collects quality-control data from selected analytical methods on a continuing basis to determine LT-MDL's and establish LRL's. These values are re-evaluated annually based on the

most current quality-control data and may, therefore, change. [Note: In several previous NWQL documents (Connor and others, 1998; NWQL Technical Memorandum 98.07, 1998), the LRL was called the non-detection value or NDV - a term that is no longer used.]

Long Term Method Detection Level (LT-MDL) is a detection level derived by determining the standard deviation of a minimum of 24 method detection limit (MDL) spike sample measurements over an extended period of time. LT-MDL data are collected on a continuous basis to assess year-to-year variations in the LT-MDL. The LT-MDL controls false positive error. The chance of falsely reporting a concentration at or greater than the LT-MDL for a sample that did not contain the analyte is predicted to be less than or equal to 1 percent.

Macrophytes are the macroscopic plants in the aquatic environment. The most common macrophytes are the rooted vascular plants that are usually arranged in zones in aquatic ecosystems and restricted in the area by the extent of illumination through the water and sediment deposition along the shoreline.

Measuring point (MP) is an arbitrary permanent reference point from which the distance to water surface in a well is measured to obtain water level.

Membrane filter is a thin microporous material of specific pore size used to filter bacteria, algae, and other very small particles from water.

Metamorphic stage refers to the stage of development that an organism exhibits during its transformation from an immature form to an adult form. This developmental process exists for most insects, and the degree of difference from the immature stage to the adult form varies from relatively slight to pronounced, with many intermediates. Examples of metamorphic stages of insects are egg-larva-adult or egg-nymph-adult.

Method Detection Limit (MDL) is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero. It is determined from the analysis of a sample in a given matrix containing the analyte (U.S. Environmental Protection Agency, 1997). At the MDL concentration, the risk of a false positive is predicted to be less than or equal to 1 percent.

Methylene blue active substances (MBAS) are apparent detergents. The determination depends on the formation of a blue color when methylene blue dye reacts with synthetic anionic detergent compounds.

Micrograms per gram (UG/G, $\mu\text{g/g}$) is a unit expressing the concentration of a chemical constituent as the mass (micrograms) of the element per unit mass (gram) of material analyzed.

Micrograms per kilogram (UG/KG, $\mu\text{g/kg}$) is a unit expressing the concentration of a chemical constituent as the mass (micrograms) of the constituent per unit mass (kilogram) of the material analyzed. One microgram per kilogram is equivalent to 1 part per billion.

Micrograms per liter (UG/L, $\mu\text{g/L}$) is a unit expressing the concentration of chemical constituents in water as mass (micrograms) of constituent per unit volume (liter) of water.

One thousand micrograms per liter is equivalent to 1 milligram per liter.

Microsiemens per centimeter (US/CM, $\mu\text{S}/\text{cm}$) is a unit expressing the amount of electrical conductivity of a solution as measured between opposite faces of a centimeter cube of solution at a specified temperature. Siemens is the International System of Units nomenclature. It is synonymous with mhos and is the reciprocal of resistance in ohms.

Milligrams per liter (MG/L, mg/L) is a unit for expressing the concentration of chemical constituents in water as the mass (milligrams) of constituent per unit volume (liter) of water. Concentration of suspended sediment also is expressed in mg/L and is based on the mass of dry sediment per liter of water-sediment mixture.

Minimum Reporting Level (MRL) is the smallest measured concentration of a constituent that may be reliably reported by using a given analytical method (Timme, 1995).

Miscellaneous site, or miscellaneous station, is a site where streamflow, sediment, and/or water-quality data are collected once, or more often on a random or discontinuous basis.

Most probable number (MPN) is an index of the number of coliform bacteria that, more probably than any other number, would give the results shown by the laboratory examination; it is not an actual enumeration. MPN is determined from the distribution of gas-positive cultures among multiple inoculated tubes.

Multiple-plate samplers are artificial substrates of known surface area used for obtaining benthic invertebrate samples. They consist of a series of spaced, hardboard plates on an eyebolt.

Nanograms per liter (NG/L, ng/L) is a unit expressing the concentration of chemical constituents in solution as mass (nanograms) of solute per unit volume (liter) of water. One million nanograms per liter is equivalent to 1 milligram per liter.

National Geodetic Vertical Datum of 1929 (NGVD of 1929) is a geodetic datum derived from a general adjustment of the first order level nets of the United States and Canada. It was formerly called "Sea Level Datum of 1929" or "mean sea level" in this series of reports. Although the datum was derived from the average sea level over a period of many years at 26 tide stations along the Atlantic, Gulf of Mexico, and Pacific Coasts, it does not necessarily represent local mean sea level at any particular place. See NOAA web site: <http://www.ngs.noaa.gov/faqs.html#WhatVD29VD88>

National Stream-Quality Accounting Network (NASQAN) monitors the water quality of large rivers within four of the Nation's largest river basins--the Mississippi, Columbia, Colorado, and Rio Grande. The network consists of 39 stations. Samples are collected with sufficient frequency that the flux of a wide range of constituents can be estimated. The objective of NASQAN is to characterize the water quality of these large rivers by measuring concentration and mass transport of a wide range of dissolved and suspended constituents, including nutrients, major ions, dissolved and sediment-bound heavy metals, common pesticides, and inorganic and organic forms of carbon. This information will be used (1) to describe the long-term trends and changes in concentration and transport of these constituents; (2) to test the findings of the National Water-Quality Assessment Program (NAWQA); (3) to characterize processes

unique to large-river systems such as storage and re-mobilization of sediments and associated contaminants; and (4) to refine existing estimates of off-continent transport of water, sediment, and chemicals for assessing human effects on the world's oceans and for determining global cycles of carbon, nutrients, and other chemicals.

The National Atmospheric Deposition Program/ National Trends Network (NADP/NTN) provides continuous measurement and assessment of the chemical climate of precipitation throughout the United States. As the lead federal agency, the USGS works together with over 100 organizations to accomplish the following objectives; (1) Provide a long-term, spatial and temporal record of atmospheric deposition generated from a network of 191 precipitation chemistry monitoring sites. (2) Provide the mechanism to evaluate the effectiveness of the significant reduction in SO_2 emissions that began in 1995 as implementation of the Clean Air Act Amendments (CAAA) occurred. (3) Provide the scientific basis and nationwide evaluation mechanism for implementation of the Phase II CAAA emission reductions for SO_2 and NO_x scheduled to begin in 2000.

The National Water-Quality Assessment (NAWQA) Program of the U.S. Geological Survey is a longterm program with goals to describe the status and trends of water-quality conditions for a large, representative part of the Nation's ground- and surface-water resources; provide an improved understanding of the primary natural and human factors affecting these observed conditions and trends; and provide information that supports development and evaluation of management, regulatory, and monitoring decisions by other agencies.

Nekton are the consumers in the aquatic environment and consist of large free-swimming organisms that are capable of sustained, directed mobility.

Nephelometric turbidity unit (NTU) is the measurement for reporting turbidity that is based on use of a standard suspension of Formazin. Turbidity measured in NTU uses nephelometric methods that depend on passing specific light of a specific wavelength through the sample.

Open or screened interval is the length of unscreened opening or of well screen through which water enters a well, in feet below land surface.

Organic carbon (OC) is a measure of organic matter present in aqueous solution, suspension, or bottom sediments. May be reported as dissolved organic carbon (DOC), suspended organic carbon (SOC), or total organic carbon (TOC).

Organism is any living entity.

Organism count/area refers to the number of organisms collected and enumerated in a sample and adjusted to the number per area habitat, usually square meter (m^2), acre, or hectare. Periphyton, benthic organisms, and macrophytes are expressed in these terms.

Organism count/volume refers to the number of organisms collected and enumerated in a sample and adjusted to the number per sample volume, usually milliliter (mL) or liter (L). Numbers of planktonic organisms can be expressed in these terms.

Total organism count is the total number of organisms collected and enumerated in any particular sample.

Organochlorine compounds are any chemicals that contain carbon and chlorine. Organochlorine compounds that are important in investigations of water, sediment, and biological quality include certain pesticides and industrial compounds.

Parameter Code is a 5-digit number used in the U.S. Geological Survey computerized data system, National Water Information System (NWIS), to uniquely identify a specific constituent or property.

Partial-record station is a site where discrete measurements of one or more hydrologic parameters are obtained over a period of time without continuous data being recorded or computed. A common example is a crest-stage gage partial-record station at which only peak stages and flows are recorded.

Particle size is the diameter, in millimeters (mm), of a particle determined by sieve or sedimentation methods. The sedimentation method utilizes the principle of Stokes Law to calculate sediment particle sizes. Sedimentation methods (pipet, bottom-withdrawal tube, visual-accumulation tube, Sedigraph) determine fall diameter of particles in either distilled water (chemically dispersed) or in native water (the river water at the time and point of sampling).

Particle-size classification used in this report agrees with the recommendation made by the American Geophysical Union Subcommittee on Sediment Terminology. The classification is as follows:

Classification	Size (mm)	Method of analysis
Clay	0.00024 - 0.004	Sedimentation
Silt	0.004 - 0.062	Sedimentation
Sand	0.062 - 2.0	Sedimentation/ sieve
Gravel	2.0 - 64.0	Sieve

The particle-size distributions given in this report are not necessarily representative of all particles in transport in the stream. Most of the organic matter is removed, and the sample is subjected to mechanical and chemical dispersion before analysis in distilled water. Chemical dispersion is not used for native water analysis.

Percent composition or percent of total is a unit for expressing the ratio of a particular part of a sample or population to the total sample or population, in terms of types, numbers, weight, or volume.

Periodic station is a site where stage, discharge, sediment, chemical, or other hydrologic measurements are made one or more times during a year, but at a frequency insufficient to develop a daily record.

Periphyton is the assemblage of microorganisms attached to and living upon submerged solid surfaces. While primarily consisting of algae, they also include bacteria, fungi, protozoa, rotifers, and other small organisms. Periphyton are useful indicators of water quality.

Pesticides are chemical compounds used to control undesirable organisms. Major categories of pesticides include insecticides, miticides, fungicides, herbicides, and rodenticides.

pH of water is the negative logarithm of the hydrogen-ion activity. Solutions with pH less than 7 are termed "acidic," and solutions with a pH greater than 7 are termed "basic." Solutions with a pH of 7 are neutral. The presence and concentration of many dissolved chemical constituents found in water are, in part, influenced by the hydrogen-ion activity of water. Biological processes including growth, distribution of organisms, and toxicity of the water to organisms are also influenced, in part, by the hydrogen-ion activity of water.

Picocurie (PC, pCi) is one trillionth (1×10^{-12}) of the amount of radioactive nuclide represented by a curie (ci). A curie is the quantity of any radioactive nuclide that yields 3.7×10^{10} radioactive disintegrations per second (dps). A picocurie yields 0.037 dps, or 2.22 dpm (disintegrations per minute).

Plankton is the community of suspended, floating, or weakly swimming organisms that live in the open water of lakes and rivers. Concentrations are expressed as a number of cells per milliliter (cells/mL of sample).

Phytoplankton is the plant part of the plankton. They are usually microscopic, and their movement is subject to the water currents. Phytoplankton growth is dependent upon solar radiation and nutrient substances. Because they are able to incorporate as well as release materials to the surrounding water, the phytoplankton have a profound effect upon the quality of the water. They are the primary food producers in the aquatic environment and are commonly known as algae.

Blue-green algae (*Cyanophyta*) are a group of phytoplankton organisms having a blue pigment, in addition to the green pigment called chlorophyll. Blue-green algae often cause nuisance conditions in water.

Diatoms are the unicellular or colonial algae having a siliceous shell. Their concentrations are expressed as number of cells per milliliter (cells/mL) of sample.

Euglenoids (*Euglenophyta*) are a group of algae that are usually free-swimming and rarely creeping. They have the ability to grow either photosynthetically in the light or heterotrophically in the dark.

Fire algae (*Pyrrhophyta*) are a group of algae that are free-swimming unicells characterized by a red pigment spot.

Green algae have chlorophyll pigments similar in color to those of higher green plants. Some forms produce algae mats or floating "moss" in lakes. Their concentrations are expressed as number of cells per milliliter (cells/mL) of sample.

Zooplankton is the animal part of the plankton. Zooplankton are capable of extensive movements within the water column and are often large enough to be seen with the unaided eye. Zooplankton are secondary consumers feeding upon bacteria, phytoplankton, and detritus. Because they are the grazers in the aquatic

environment, the zooplankton are a vital part of the aquatic food web. The zooplankton community is dominated by small crustaceans and rotifers.

Polychlorinated biphenyls (PCB's) are industrial chemicals that are mixtures of chlorinated biphenyl compounds having various percentages of chlorine. They are similar in structure to organochlorine insecticides.

Polychlorinated naphthalenes (PCN's) are industrial chemicals that are mixtures of chlorinated naphthalene compounds. They have properties and applications similar to polychlorinated biphenyls (PCB's) and have been identified in commercial PCB preparations.

Primary productivity is a measure of the rate at which new organic matter is formed and accumulated through photosynthetic and chemosynthetic activity of producer organisms (chiefly, green plants). The rate of primary production is estimated by measuring the amount of oxygen released (oxygen method) or the amount of carbon assimilated (carbon method) by the plants.

Primary productivity (carbon method) is expressed as milligrams of carbon per area per unit time [$\text{mg C}/(\text{m}^2/\text{time})$] for periphyton and macrophytes or per volume [$\text{mg C}/(\text{m}^3/\text{time})$] for phytoplankton. Carbon method defines the amount of carbon dioxide consumed as measured by radioactive carbon (carbon-14). The carbon-14 method is of greater sensitivity than the oxygen light and dark bottle method and is preferred for use in unenriched waters. Unit time may be either the hour or day, depending on the incubation period.

Primary productivity (oxygen method) is expressed as milligrams of oxygen per area per unit time [$\text{mg O}/(\text{m}^2/\text{time})$] for periphyton and macrophytes or per volume [$\text{mg O}/(\text{m}^3/\text{time})$] for phytoplankton. Oxygen method defines production and respiration rates as estimated from changes in the measured dissolved-oxygen concentration. The oxygen light and dark bottle method is preferred if the rate of primary production is sufficient for accurate measurements to be made within 24 hours. Unit time may be either the hour or day, depending on the incubation period.

Radioisotopes are isotopic forms of an element that exhibit radioactivity. Isotopes are varieties of a chemical element that differ in atomic weight, but are very nearly alike in chemical properties. The difference arises because the atoms of the isotopic forms of an element differ in the number of neutrons in the nucleus; for example, ordinary chlorine is a mixture of isotopes having atomic weights of 35 and 37, and the natural mixture has an atomic weight of about 35.453. Many of the elements similarly exist as mixtures of isotopes, and a great many new isotopes have been produced in the operation of nuclear devices such as the cyclotron. There are 275 isotopes of the 81 stable elements, in addition to more than 800 radioactive isotopes.

Recoverable from bottom material is the amount of a given constituent that is in solution after a representative sample of bottom material has been digested by a method (usually using an acid or mixture of acids) that results in dissolution of readily soluble substances. Complete dissolution of all bottom material is not achieved by the digestion treatment and thus the determination represents less than the total amount (that is, less than 95 percent) of the constituent in the

sample. To achieve comparability of analytical data, equivalent digestion procedures would be required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results.

Recurrence interval, also referred to as return period, is the average time, usually expressed in years, between occurrences of hydrologic events of a specified type (such as exceedances of a specified high flow or non-exceedance of a specified low flow). The terms "return period" and "recurrence interval" do not imply regular cyclic occurrence. The actual times between occurrences vary randomly, with most of the times being less than the average and a few being substantially greater than the average. For example, the 100-year flood is the flow rate that is exceeded by the annual maximum peak flow at intervals whose average length is 100 years (that is, once in 100 years, on average); almost two-thirds of all exceedances of the 100-year flood occur less than 100 years after the previous exceedance, half occur less than 70 years after the previous exceedance, and about one-eighth occur more than 200 years after the previous exceedance. Similarly, the 7-day 10-year low flow ($7Q_{10}$) is the flow rate below which the annual minimum 7-day-mean flow dips at intervals whose average length is 10 years (that is, once in 10 years, on average); almost two-thirds of the non-exceedances of the $7Q_{10}$ occur less than 10 years after the previous non-exceedance, half occur less than 7 years after, and about one-eighth occur more than 20 years after the previous non-exceedance. The recurrence interval for annual events is the reciprocal of the annual probability of occurrence. Thus, the 100-year flood has a 1-percent chance of being exceeded by the maximum peak flow in any year, and there is a 10-percent chance in any year that the annual minimum 7-day-mean flow will be less than the $7Q_{10}$.

Replicate samples are a group of samples collected in a manner such that the samples are thought to be essentially identical in composition.

Return period is the average time interval between occurrences of a hydrological event of a given or greater magnitude, usually expressed in years. May also be called recurrence interval.

River mile is the distance of a point on a river measured in miles from the river's mouth along the low-water channel.

River mileage is the linear distance along the meandering path of a stream channel determined in accordance with Bulletin No. 14 (October 1968) of the Water Resources Council.

Runoff in inches (IN., in.) is the depth, in inches, to which the drainage area would be covered if all the runoff for a given time period were uniformly distributed on it.

Sea level refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)—a geodetic datum derived from a general adjustment of the first-order level nets of the United States and Canada, formerly called Sea Level Datum of 1929. See: http://www.co-ops.nos.noaa.gov/glossary/gloss_n.html#NGVD

Sediment is solid material that is transported by, suspended in, or deposited from water. It originates mostly from disintegrated rocks; it also includes chemical and biochemical precipitates and decomposed organic material, such as humus. The quantity, characteristics, and cause of the occurrence of sediment in streams are influenced by environmen-

tal factors. Some major factors are degree of slope, length of slope, soil characteristics, land usage, and quantity and intensity of precipitation.

Bed load is the sediment that is transported in a stream by rolling, sliding, or skipping along or very close to the bed. In this report, bed load is considered to consist of particles in transit from the bed to an elevation equal to the top of the bed-load sampler nozzle (usually within 0.25 ft of the streambed).

Bed-load discharge (tons per day) is the quantity of sediment moving as bed load, reported as dry weight, that passes a cross section in a given time.

Suspended sediment is the sediment that is maintained in suspension by the upward components of turbulent currents or that exists in suspension as a colloid.

Suspended-sediment concentration is the velocity-weighted concentration of suspended sediment in the sampled zone (from the water surface to a point approximately 0.3 ft above the bed) expressed as milligrams of dry sediment per liter of water-sediment mixture (mg/L). The entire sample is used for the analysis.

Mean concentration of suspended sediment is the time-weighted concentration of suspended sediment passing a stream section during a 24-hour day.

Suspended-sediment discharge (tons/day) is the quantity of sediment moving in suspension, reported as dry weight, that passes a cross section in a given time. It is calculated in units of tons per day as follows: concentration (mg/L) x discharge (ft³/s) x 0.0027.

Suspended-sediment load is a term that refers to material in suspension. The term needs to be qualified, such as "annual suspended-sediment load" or "sand-size suspended-sediment load," and so on. It is not synonymous with either suspended-sediment discharge or concentration.

Suspended total residue at 105 Deg. C concentration is the concentration of suspended sediment in the sampled zone expressed as milligrams of dry sediment per liter of water-sediment mixture (mg/l). A small aliquot of the sample is used for the analysis.

Total sediment discharge (tons/day) is the sum of the suspended-sediment discharge and the bed-load discharge. It is the total quantity of sediment, reported as dry weight, that passes a cross section in a given time.

Total sediment load or total load is a term that refers to the total sediment (bed load plus suspended-sediment load) that is in transport. The term needs to be qualified, such as "annual suspended-sediment load" or "sand-size suspended-sediment load," and so on. It is not synonymous with total sediment discharge.

Seven-day 10-year low flow (7Q₁₀, 7Q₁₀) is the minimum flow averaged over 7 consecutive days that is expected to occur on average, once in any 10-year period. The 7Q₁₀ has a 10-percent chance of occurring in any given year.

Sodium adsorption ratio (SAR) is the expression of relative activity of sodium ions in exchange reactions within

soil and is an index of sodium or alkali hazard to the soil. Waters range in respect to sodium hazard from those which can be used for irrigation on almost all soils to those which are generally unsatisfactory for irrigation.

Solute is any substance that is dissolved in water.

Specific conductance is a measure of the ability of a water to conduct an electrical current. It is expressed in microsiemens per centimeter at 25 °C. Specific conductance is related to the type and concentration of ions in solution and can be used for approximating the dissolved-solids content of the water. Commonly, the concentration of dissolved solids (in milligrams per liter) is from 55 to 75 percent of the specific conductance (in microsiemens). This relation is not constant from stream to stream, and it may vary in the same source with changes in the composition of the water.

Stable isotope ratio (per MILL/MIL) is a unit expressing the ratio of the abundance of two radioactive isotopes. Isotope ratios are used in hydrologic studies to determine the age or source of specific waters, to evaluate mixing of different waters, as an aid in determining reaction rates, and other chemical or hydrologic processes.

Stage: See "Gage height."

Stage-discharge relation is the relation between the water-surface elevation, termed stage (gage height), and the volume of water flowing in a channel per unit time.

Streamflow is the discharge that occurs in a natural channel. Although the term "discharge" can be applied to the flow of a canal, the word "streamflow" uniquely describes the discharge in a surface stream course. The term "streamflow" is more general than "runoff" as streamflow may be applied to discharge whether or not it is affected by diversion or regulation.

Substrate is the physical surface upon which an organism lives.

Artificial substrate is a device which is purposely placed in a stream or lake for colonization of organisms. The artificial substrate simplifies the community structure by standardizing the substrate from which each sample is taken. Examples of artificial substrates are basket samplers (made of wire cages filled with clean streamside rocks) and multiplate samplers (made of hardboard) for benthic organism collection, and plexi-glass strips for periphyton collection.

Natural substrate refers to any naturally occurring immersed or submersed solid surface, such as a rock or tree, upon which an organism lives.

Surface area of a lake or impoundment is that area encompassed by the boundary of the lake or impoundment as shown on USGS topographic maps, or on other available maps or photographs. The computed surface areas reflect the water levels of the lakes or impoundments at the times when the information for the maps or photographs was obtained.

Surficial bed material is the top 0.1 to 0.2 ft of the bed material that is sampled using U.S. Series Bed-Material Samplers.

Suspended (as used in tables of chemical analyses) refers to the amount (concentration) of undissolved material in a water-sediment mixture. It is associated with the material retained on a 0.45-micrometer filter.

Suspended, recoverable is the amount of a given constituent that is in solution after the part of a representative suspended-sediment sample that is retained on a 0.45-micrometer membrane filter has been digested by a method (usually using a dilute acid solution) that results in dissolution of only readily soluble substances. Complete dissolution of all the particulate matter is not achieved by the digestion treatment and thus the determination represents something less than the "total" amount (that is, less than 95 percent) of the constituent present in the sample. To achieve comparability of analytical data, equivalent digestion procedures are required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results.

Determinations of "suspended, recoverable" constituents are made either by analyzing portions of the material collected on the filter or, more commonly, by difference, based on determinations of (1) dissolved and (2) total recoverable concentrations of the constituent.

Suspended, total is the total amount of a given constituent in the part of a representative suspended-sediment sample that is retained on a 0.45-micrometer membrane filter. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent determined. Knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to determine when the results should be reported as "suspended, total."

Determinations of "suspended, total" constituents are made either by analyzing portions of the material collected on the filter or, more commonly, by difference, based on determinations of (1) dissolved and (2) total concentrations of the constituent.

Synoptic Studies are short-term investigations of specific water-quality conditions during selected seasonal or hydrologic periods to provide improved spatial resolution for critical water-quality conditions. For the period and conditions sampled, they assess the spatial distribution of selected water-quality conditions in relation to causative factors, such as land use and contaminant sources.

Taxonomy is the division of biology concerned with the classification and naming of organisms. The classification of organisms is based upon a hierarchical scheme beginning with Kingdom and ending with Species at the base. The higher the classification level, the fewer features the organisms have in common. For example, the taxonomy of a particular mayfly, *Hexagenia limbata*, is the following:

Kingdom	Animal
Phylum	Arthropoda
Class	Insecta
Order	Ephemeroptera
Family	Ephemeridae
Genus	<i>Hexagenia</i>
Species	<i>Hexagenia limbata</i>

Time-weighted average is computed by multiplying the number of days in the sampling period by the concentrations of individual constituents for the corresponding period and dividing the sum of the products by the total number of days. A time-weighted average represents the composition of

water that would be contained in a vessel or reservoir that had received equal quantities of water from the stream each day for the year.

Tons per acre-foot is the dry mass of dissolved solids in 1 acre-foot of water. It is computed by multiplying the concentration of the constituent, in milligrams per liter, by 0.00136.

Tons per day (T/DAY, tons/d) is the rate representing a mass of 1 ton of a constituent in streamflow passing a cross section in 1 day. It is equivalent to 2,000 pounds per day, or 0.9072 metric tons per day.

Total is the total amount of a given constituent in a representative suspended-sediment sample, regardless of the constituent's physical or chemical form. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent present in both the dissolved and suspended phases of the sample. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total." (Note that the word "total" does double duty here, indicating both that the sample consists of a suspended-sediment mixture and that the analytical method determined all of the constituent in the sample.)

Total discharge is the quantity of a given constituent, measured as dry mass or volume, that passes a stream cross section per unit of time. When referring to constituents other than water, this term needs to be qualified, such as "total sediment discharge," "total chloride discharge," and so on.

Total in bottom material is the total amount of a given constituent in a representative sample of bottom material. This term is used only when the analytical procedure assures measurement of at least 95 percent of the constituent determined. A knowledge of the expected form of the constituent in the sample, as well as the analytical methodology used, is required to judge when the results should be reported as "total in bottom material."

Total length (fish) is the straight-line distance from the anterior point of a fish specimen's snout, with the mouth closed, to the posterior end of the caudal (tail) fin, with the lobes of the caudal fin squeezed together.

Total load refers to all of a constituent in transport. When referring to sediment, it includes suspended load plus bed load.

Total recoverable is the amount of a given constituent that is in solution after a representative suspended-sediment sample has been digested by a method (usually using a dilute acid solution) that results in dissolution of only readily soluble substances. Complete dissolution of all particulate matter is not achieved by the digestion treatment, and thus the determination represents something less than the "total" amount (that is, less than 95 percent) of the constituent present in the dissolved and suspended phases of the sample. To achieve comparability of analytical data, equivalent digestion procedures are required of all laboratories performing such analyses because different digestion procedures are likely to produce different analytical results.

Turbidity is a measurement of the collective optical properties of a water sample that cause light to be scattered and absorbed rather than transmitted in straight lines; the higher the intensity of scattered light, the higher the turbid-

ity. Turbidity is expressed in nephelometric turbidity units (NTU) or Formazin turbidity units (FTU) depending on the method and equipment used.

Volatile organic compounds (VOC's) are organic compounds that can be isolated from the water phase of a sample by purging the water sample with inert gas, such as helium, and subsequently analyzed by gas chromatography. Many VOC's are manmade chemicals that are used and produced in the manufacture of paints, adhesives, petroleum products, pharmaceuticals, and refrigerants. They are often components of fuels, solvents, hydraulic fluids, paint thinners, and dry cleaning agents commonly used in urban settings. VOC contamination of drinking-water supplies is a human health concern because many are toxic and are known or suspected human carcinogens (U.S. Environmental Protection Agency, 1996).

Water level is the water-surface elevation or stage of the free surface of a body of water above or below any datum (see "Gage height"), or the surface of water standing in a well, usually indicative of the position of the water table or other potentiometric surface.

Water table is the surface of a ground-water body at which the water is at atmospheric pressure.

Water-table aquifer is an unconfined aquifer within which is found the water table.

Water year in U.S. Geological Survey reports dealing with surface-water supply is the 12-month period October 1 through September 30. The water year is designated by the calendar year in which it ends and which includes 9 of the 12 months. Thus, the year ending September 30, 2000, is called the "2000 water year."

WDR is used as an abbreviation for "Water-Data Report" in the REVISED RECORDS paragraph to refer to State annual hydrologic-data reports. (WRD was used as an abbreviation for "Water-Resources Data" in reports published prior to 1976.)

Weighted average is used in this report to indicate discharge-weighted average. It is computed by multiplying the discharge for a sampling period by the concentrations of individual constituents for the corresponding period and dividing the sum of the products by the sum of the discharges. A discharge-weighted average approximates the composition of water that would be found in a reservoir containing all the water passing a given location during the water year after thorough mixing in the reservoir.

Well is an excavation (pit, hole, tunnel), generally cylindrical in form and often walled in, drilled, dug, driven, bored, or jetted into the ground to such a depth as to penetrate water-yielding geologic material and allow the water to flow or to be pumped to the surface.

Wet weight refers to the weight of animal tissue or other substance including its contained water.

WSP is used as an abbreviation for "Water-Supply Paper" in reference to previously published reports

TECHNIQUES OF WATER-RESOURCES INVESTIGATIONS OF THE U.S. GEOLOGICAL SURVEY

The U.S.G.S. publishes a series of manuals describing procedures for planning and conducting specialized work in water-resources investigations. The material is grouped under major subject headings called books and is further divided into sections and chapters. For example, section A of book 3 (Applications of Hydraulics) pertains to surface water. The chapter, the unit of publication, is limited to a narrow field of subject matter. This format permits flexibility in revision and publication as the need arises.

The reports listed below are for sale by the U.S.G.S., Information Services, Box 25286, Federal Center, Denver, Colorado 80225 (authorized agent of the Superintendent of Documents, Government Printing Office). Prepayment is required. Remittance should be made in the form of a check or money order payable to the "U.S. Geological Survey." Prices are not included because they are subject to change. Current prices can be obtained by writing to the above address. When ordering or inquiring about prices for any of these publications, please give the title, book number, chapter number, and mention the "U.S. Geological Survey Techniques of Water-Resources Investigations."

WATER RESOURCES DATA-NEW JERSEY, 2000

EXPLANATION

- 1 WATERSHED MANAGEMENT AREA BOUNDARY AND NUMBER
- SURFACE-WATER-QUALITY STATION AND NUMBER
 - ▽ 442760 BACKGROUND
 - ▽ 4430 DELAWARE RIVER
 - ◇ 3895 LAND-USE INDICATOR
 - ▽ 367625 WATERSHED RECONNAISSANCE
 - 367780 STATEWIDE STATUS
 - ▽ 4464 WATERSHED INTEGRATOR
 - 409375 PINELANDS NETWORK
 - 3880 WATER-QUALITY MONITOR

PENNSYLVANIA

Notes: Station numbers are abbreviated; first two digits (01) and last two digits (if zeros) are omitted. Examples: station number 01400500 is shown as 4005; station number 01403150 is shown as 403150.

HUDSON RIVER BASIN

01367625 WALLKILL RIVER AT SPARTA, NJ

LOCATION.--Lat 41°02'20", Long 74°37'48", Sussex County, Hydrologic Unit 02020007, 0.4 mi northeast of Sparta, 1.2 mi downstream of outlet of Lake Mohawk, and 1.8 mi east of Fox Hollow Lake.

DRAINAGE AREA.--5.88 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 2.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO-CHLOR, WATER, FLTRD REC (UG/L) (49260)	ALA-CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA-ZINE, WATER, DISS, REC (UG/L) (39632)	BEN-FLUR-ALIN WAT FLD 0.7 U GF, REC (UG/L) (82673)	BUTYL-ATE, WATER, DISS, REC (UG/L) (04028)	CAR-BARYL WATER, FLTRD 0.7 U GF, REC (UG/L) (82680)	CARBO-FURAN WATER, FLTRD 0.7 U GF, REC (UG/L) (82674)	CHLOR-PYRIFOS, DIS-SOLVED (UG/L) (38933)	CYANA-ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER, FLTRD 0.7 U GF, REC (UG/L) (82682)	DEETHYL-ATRA-ZINE, WATER, DISS, REC (UG/L) (04040)

HUDSON RIVER BASIN

01367800 PAPAKATING CREEK AT PELLETOWN, NJ

LOCATION.--Lat 41°09'45", long 74°40'31", Sussex County, Hydrologic Unit 02020007, at bridge on State Route 565 in Pelletown, 1.5 mi southeast of Wykertown, and 4.8 mi upstream of confluence with West Branch.

DRAINAGE AREA.--15.8 mi².

PERIOD OF RECORD.--Water years 1959-63, 1999 to current year..

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 2.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO- CHLOR, WATER FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, DISS, REC (UG/L) (04028)	CAR- BARYL WATER FLTRD 0.7 U GF, REC (UG/L) (82680)	CARBO- FURAN WATER FLTRD 0.7 U GF, REC (UG/L) (82674)	CHLOR- PYRIFOS DIS- SOLVED (UG/L) (38933)	CYANA- ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER FLTRD 0.7 U GF, REC (UG/L) (82682)	DEETHYL ATRA- ZINE, WATER, DISS, REC (UG/L) (04040)

01368820 DOUBLE KILL AT WAWAYANDA, NJ

LOCATION.--Lat 41°11'13", long 74°25'13", Sussex County, Hydrologic Unit 02020007, 0.4 mi downstream of Wawayanda Lake, 3.5 mi east of Vernon, and 4.6 mi upstream of Wawayanda Creek.

DRAINAGE AREA.--6.46 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Background and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 2.

HACKENSACK RIVER BASIN

01377000 HACKENSACK RIVER AT RIVERVALE, NJ

LOCATION.--Lat 40°59'55", long 73°59'27", Bergen County, Hydrologic Unit 02030103, on upstream right bank at bridge on Westwood Avenue in Rivervale, 1.5 mi upstream from Pascack Brook, 4.6 mi upstream from Oradell Dam, and 27.2 mi upstream from mouth.

DRAINAGE AREA.--58.0 mi².

PERIOD OF RECORD.--Water years 1962, 1964 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 5.

01378560 COLES BROOK AT HACKENSACK, NJ

LOCATION.--Lat 40°54'40", long 74°02'26", Bergen County, Hydrologic Unit 02030103, at bridge on Main Street in Hackensack, 0.8 mi above mouth, and 1.9 mi northwest of Teaneck.

DRAINAGE AREA.--7.0 mi².

PERIOD OF RECORD.--Water years 1962, 1965, 1967, 1998 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 5.

PASSAIC RIVER BASIN

01378780 PRIMROSE BROOK AT MORRISTOWN NATIONAL HISTORICAL PARK, NJ

LOCATION.--Lat 40°45'54", long 74°31'48", Morris County, Hydrologic Unit 02030103, at bridge on Camp Trail Road in Morristown National Historical Park, 20 ft downstream of unnamed tributary, 500 ft west of Mount Kemble, and 2.4 mi northeast of Bernardsville.

DRAINAGE AREA.--1.07 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--For the definition of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction. Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Background and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 6.

PASSAIC RIVER BASIN

01380100 BEAVER BROOK AT ROCKAWAY, NJ

LOCATION.--Lat 40°54'08", long 74°30'06", Morris County, Hydrologic Unit 02030103, at bridge on Gill Road in Rockaway, and 0.2 mi above mouth.

DRAINAGE AREA.--22.7 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 6.

PASSAIC RIVER BASIN

01381800 WHIPPANY RIVER NEAR PINE BROOK, NJ

LOCATION.--Lat 40°50'42", long 74°20'51", Morris County, Hydrologic Unit 02030103, on left upstream abutment of former bridge on Edwards Road, 200 ft downstream from bridges on Interstate 280, 0.4 mi upstream from Rockaway River, and 1.2 mi southwest of Pine Brook. Water-quality samples collected 450 ft upstream at bridge on Ridgedale Avenue.

DRAINAGE AREA.--68.5 mi².

PERIOD OF RECORD.--Water years 1963 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 6.

01382410 MACOPIN RIVER AT ECHO LAKE, NJ

LOCATION.--Lat 41°02'54", long 74°24'22", Passaic County, Hydrologic Unit 02030103, New Jersey, at bridge on Echo Lake Road, 0.1 mi downstream of Echo Lake, 1.0 mi southwest of community of Echo Lake, and 1.6 mi east of Newfoundland.

DRAINAGE AREA.--4.42 mi².

PERIOD OF RECORD.--Water years 1998 and current year.

REMARKS.--No sample was collected in November/December because site was dry due to construction upstream of site. COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 3.

PASSAIC RIVER BASIN

01382500 PEQUANNOCK RIVER AT MACOPIN INTAKE DAM, NJ

LOCATION.--Lat 41°01'05", long 74°24'07", Morris County, Hydrologic Unit 02030103, on left bank 15 ft downstream from culvert at crossover between northbound and southbound lanes on State Route 23, 1,000 ft downstream from Macopin Intake Dam, 0.6 mi downstream from Macopin River, and 2.8 mi northwest of Butler.

DRAINAGE AREA.--63.7 mi².

PERIOD OF RECORD.--Water years 1924, 1962-69, 1973-79, 1991 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 3.

PASSAIC RIVER BASIN

01387500 RAMAPO RIVER NEAR MAHWAH, NJ

LOCATION.--Lat 41°05'51", long 74°09'48", Bergen County, Hydrologic Unit 02030103, on left bank 350 ft downstream from State Highway 17, 0.6 mi downstream from Mahwah River, and 1.0 mi west of Mahwah. Water-quality samples collected at bridge, 350 ft upstream from gage, at high flows.

DRAINAGE AREA.--120 mi².

PERIOD OF RECORD.--Water years 1963 to current year.

PERIOD OF DAILY RECORD.--
SUSPENDED-SEDIMENT DISCHARGE: February 1964 to June 1965.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Mixed Land Use Indicator and Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 3.

01388000 RAMAPO RIVER AT POMPTON LAKES, NJ

LOCATION.--Lat 40°59'33", long 74°16'44", Passaic County, Hydrologic Unit 02030103, in Pompton Lakes, at bridge on Paterson-Hamburg Turnpike, 2.0 mi upstream from mouth, and 450 ft downstream from dam.

DRAINAGE AREA.--160 mi².

PERIOD OF RECORD.--Water years 1923, 1962-67, 1982, 1987 to current year.

NUTRIENT AND INORGANIC CHEMICAL DATA: Water years 1923, 1962-67, 1982, 1987-96.

PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: April 1989 to current year.

SPECIFIC CONDUCTANCE: April 1989 to current year.

WATER TEMPERATURE: April 1989 to current year.

INSTRUMENTATION.--Water-quality monitor since April 1989, pumping system, data recorded hourly.

REMARKS.--Stage is measured on right end of dam at pumping station, 450 ft upstream from bridge. Nutrient and inorganic chemical data from 1987-96 was collected at the same location (above dam); data from earlier years was probably collected at bridge, 450 ft below dam. Interruptions in the daily record were due to instrument or pumping system malfunction.

EXTREMES FOR PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: maximum, 15.2 mg/L, Jan. 15, 2000; minimum, 4.5 mg/L, Aug. 4, 1999.

SPECIFIC CONDUCTANCE: maximum, 842 uS/cm, Jan. 18, 1999; minimum, 88 uS/cm, Sept. 7, 1999.

WATER TEMPERATURE: maximum, 31.5 °C, Jul. 5, 1999; minimum, 0.0 °C, on several days during winters.

EXTREMES FOR CURRENT YEAR.--

DISSOLVED OXYGEN: Maximum, 15.2 mg/L, Jan. 15; minimum, 6.5 mg/L, July 10, 11.

SPECIFIC CONDUCTANCE: Maximum, 510 microsiemens/cm, Feb. 15; minimum, 179 microsiemens/cm, June 8.

WATER TEMPERATURE: Maximum, 27.0°C, June 27, July 12; minimum, 0.0°C, Jan. 15.

PASSAIC RIVER BASIN

01388000 RAMAPO RIVER AT POMPTON LAKES, NJ--Continued

(Yearly hydrographs of daily mean values from the water-quality monitor)

Cross section of specific conductance, water temperature, and dissolved oxygen concentration measurements (distance from left bank looking downstream); and recorded hourly specific conductance and water temperature measurements from the water-quality monitor at the station, Ramapo River at Pompton Lakes, NJ. Dissolved oxygen concentration measurements from the monitor were not available due to instrument malfunction.

June 9, 2000

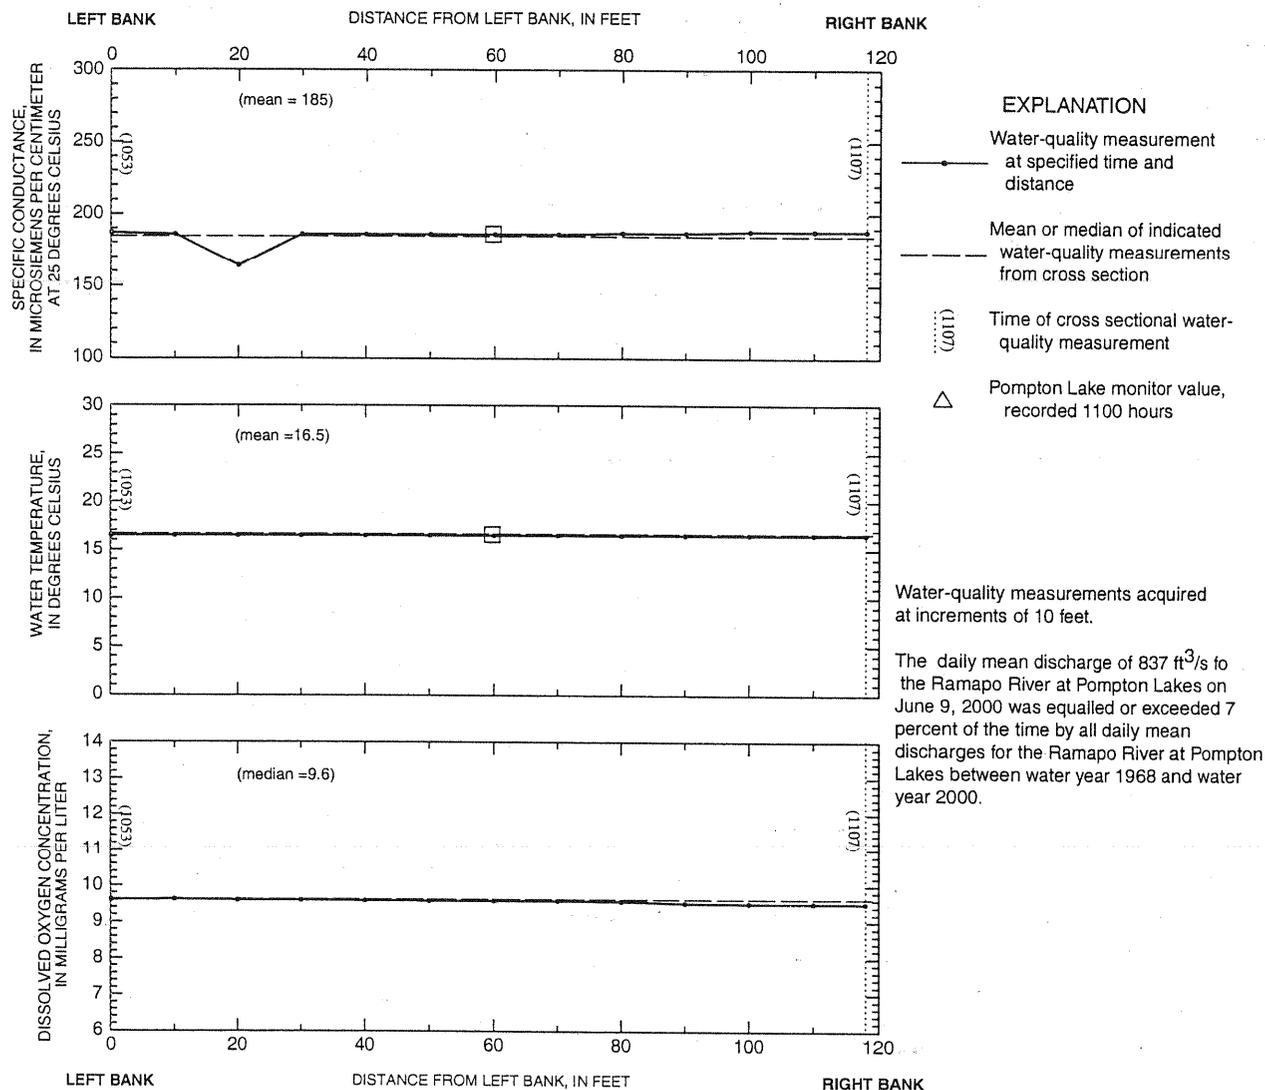

Figure 27. Cross sectional water-quality measurement with recorded monitor values, at Ramapo River at Pompton Lakes, June 9, 2000.

PASSAIC RIVER BASIN

01388500 POMPTON RIVER AT POMPTON PLAINS, NJ

LOCATION.--Lat 40°58'09", long 74°16'56", Passaic County, Hydrologic Unit 02030103, on left bank in Passaic Valley Water Commission pumping station, 100 ft upstream from bridge on Jackson Avenue (Pompton Plains Cross Road), 800 ft below confluence of Pequannock and Ramapo Rivers, and 0.7 mi east of Pompton Plains.

DRAINAGE AREA.--355 mi².

PERIOD OF RECORD.--Water years 1962-69, 1971-75, 1979-80, 1992, 1994, 1998 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 3.

01389005 PASSAIC RIVER BELOW POMPTON RIVER, AT TWO BRIDGES, NJ

LOCATION.--Lat 40°53'47", long 74°16'10", Passaic County, Hydrologic Unit 02030103, on left bank, in Two Bridges and 400 ft downstream from the Pompton River.

DRAINAGE AREA.--734 mi².

PERIOD OF RECORD.--Water years 1987 to current year.

NUTRIENT AND INORGANIC CHEMICAL DATA: Water years 1987-96.

PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: August 1989 to current year. Unpublished fragmentary water-quality records for the period March to July 1989 are available at the U.S. Geological Survey office in West Trenton, N.J.

SPECIFIC CONDUCTANCE: August 1989 to current year.

WATER TEMPERATURE: August 1989 to current year.

INSTRUMENTATION.--Water-quality monitor(s) since March 1989, pumping system, data recorded hourly. Multiple-point monitoring is necessary at this site because of poor mixing below the confluence with the Pompton river. Three intakes, left, middle, and right, are positioned at 70, 160, and 220 ft, respectively, from the edge of the monitor house on the left bank (looking downstream).

Three monitors, water pumped continuously: Water years 1989-99.

One monitor, water pumped sequentially: October 1999 to September 2000.

REMARKS.--The station is 400 ft downstream from the confluence of the Pompton river with the left bank of the Passaic river. One water-quality sensor (monitor) measures the characteristics of water pumped sequentially from three separate intakes. The station is impacted by occasional diversion of water from the Pompton river 750 ft upstream from its junction with the left bank of the Passaic river, which is 400 ft upstream from the station. Interruptions in the daily record were due to instrument or pumping-system malfunction.

EXTREMES FOR PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: maximum, 20.0 mg/L (measuring limit of instrument) from left and right intakes, on many days during July-September, 1999; minimum, 1.3 mg/L from right intake, May 29, 1991.

SPECIFIC CONDUCTANCE: maximum, 2,910 uS/cm from middle intake, Jan. 16, 1999; minimum, 101 uS/cm from right intake, Sept. 19, 20, 1999.

WATER TEMPERATURE: maximum, 31.5°C from left intake, July 7, 1999; minimum, 0.0°C from left, middle, and right intakes, on many days during winters.

EXTREMES FOR CURRENT YEAR.--

DISSOLVED OXYGEN: Maximum, 15.7 mg/L from left intake, Feb. 9; minimum, 4.3 mg/L from right intake, May 12.

SPECIFIC CONDUCTANCE: Maximum, 1,400 microsiemens/cm from right intake, Feb. 2;

minimum, 161 microsiemens/cm from right intake, Aug. 13.

WATER TEMPERATURE: Maximum, 26.5°C from right intake, June 27, July 5, 6, 12; minimum, 0.0°C, from left, middle, and right intakes on many days during January and February.

Daily mean concentration of dissolved oxygen, stage, and diversion at the station, Passaic River below Pompton River at Two Bridges, NJ, October 1, 1999 to March 31, 2000.

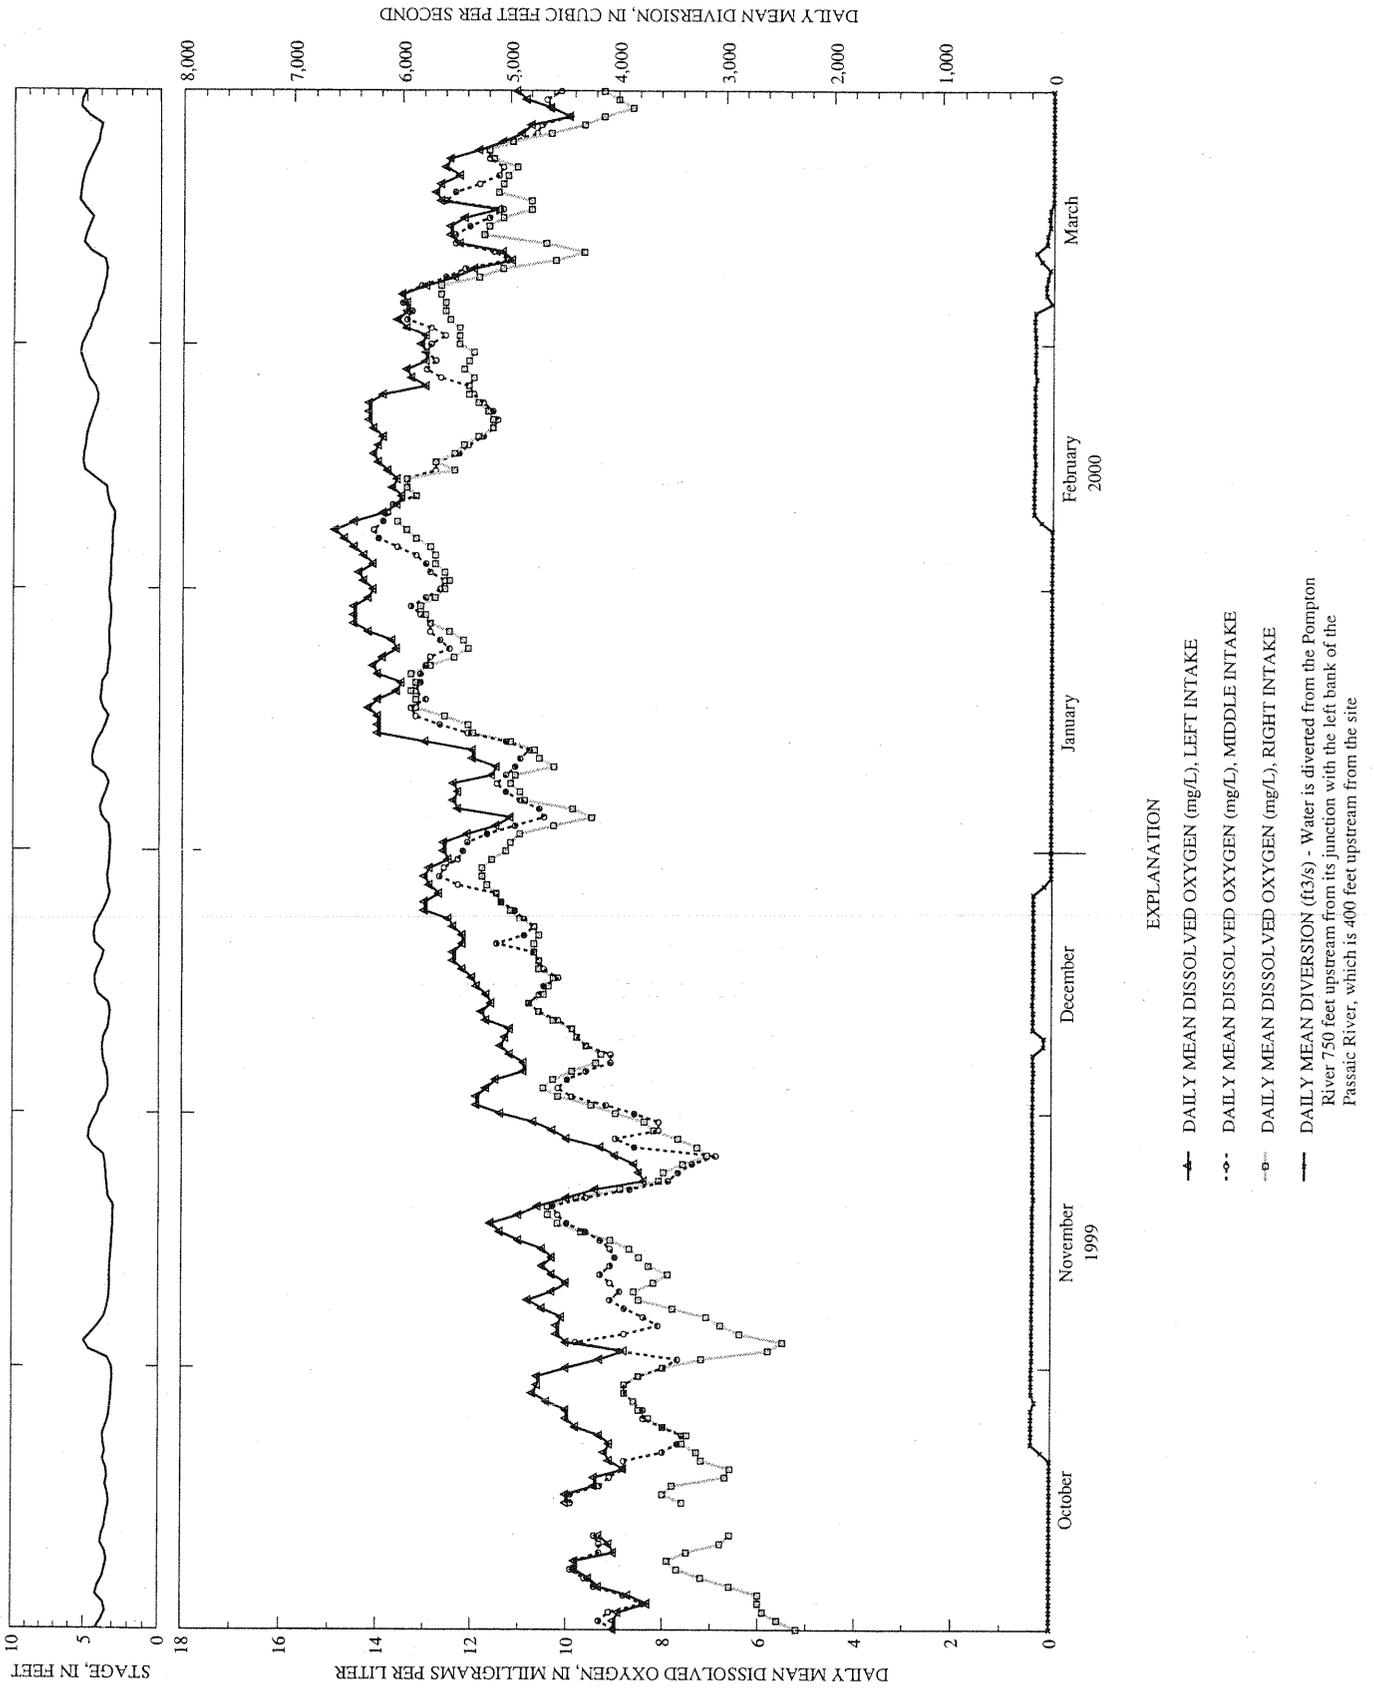

Figure 28a. Daily mean dissolved oxygen, stage, and daily diversion at Passaic River below Pompton River at Two Bridges.

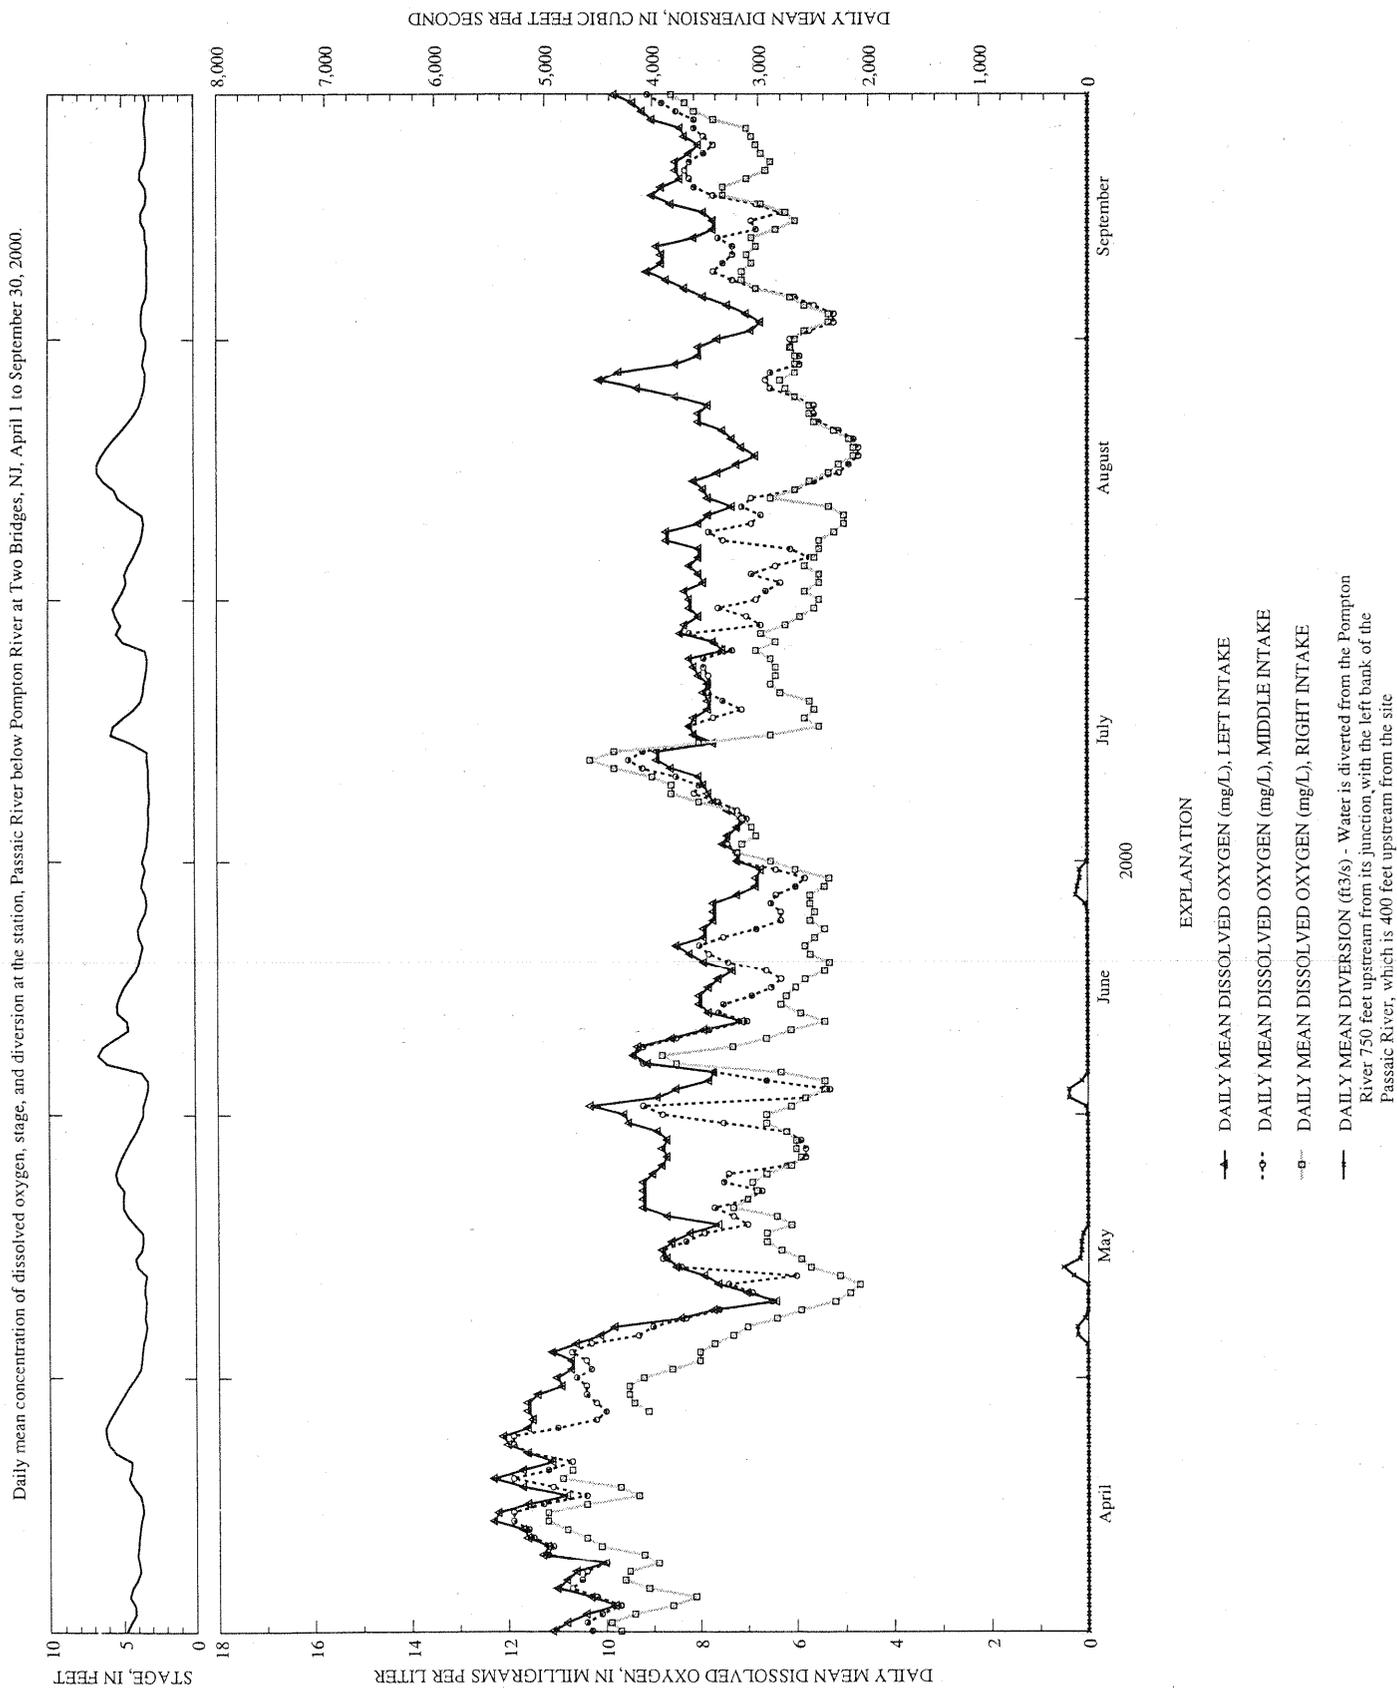

Figure 28b. Daily mean dissolved oxygen, stage, and daily diversion at Passaic River below Pompton River at Two Bridges.

Daily mean specific conductance, stage, and diversion at the station, Passaic River below Pompton River at Two Bridges, NJ, October 1, 1999 to March 31, 2000.

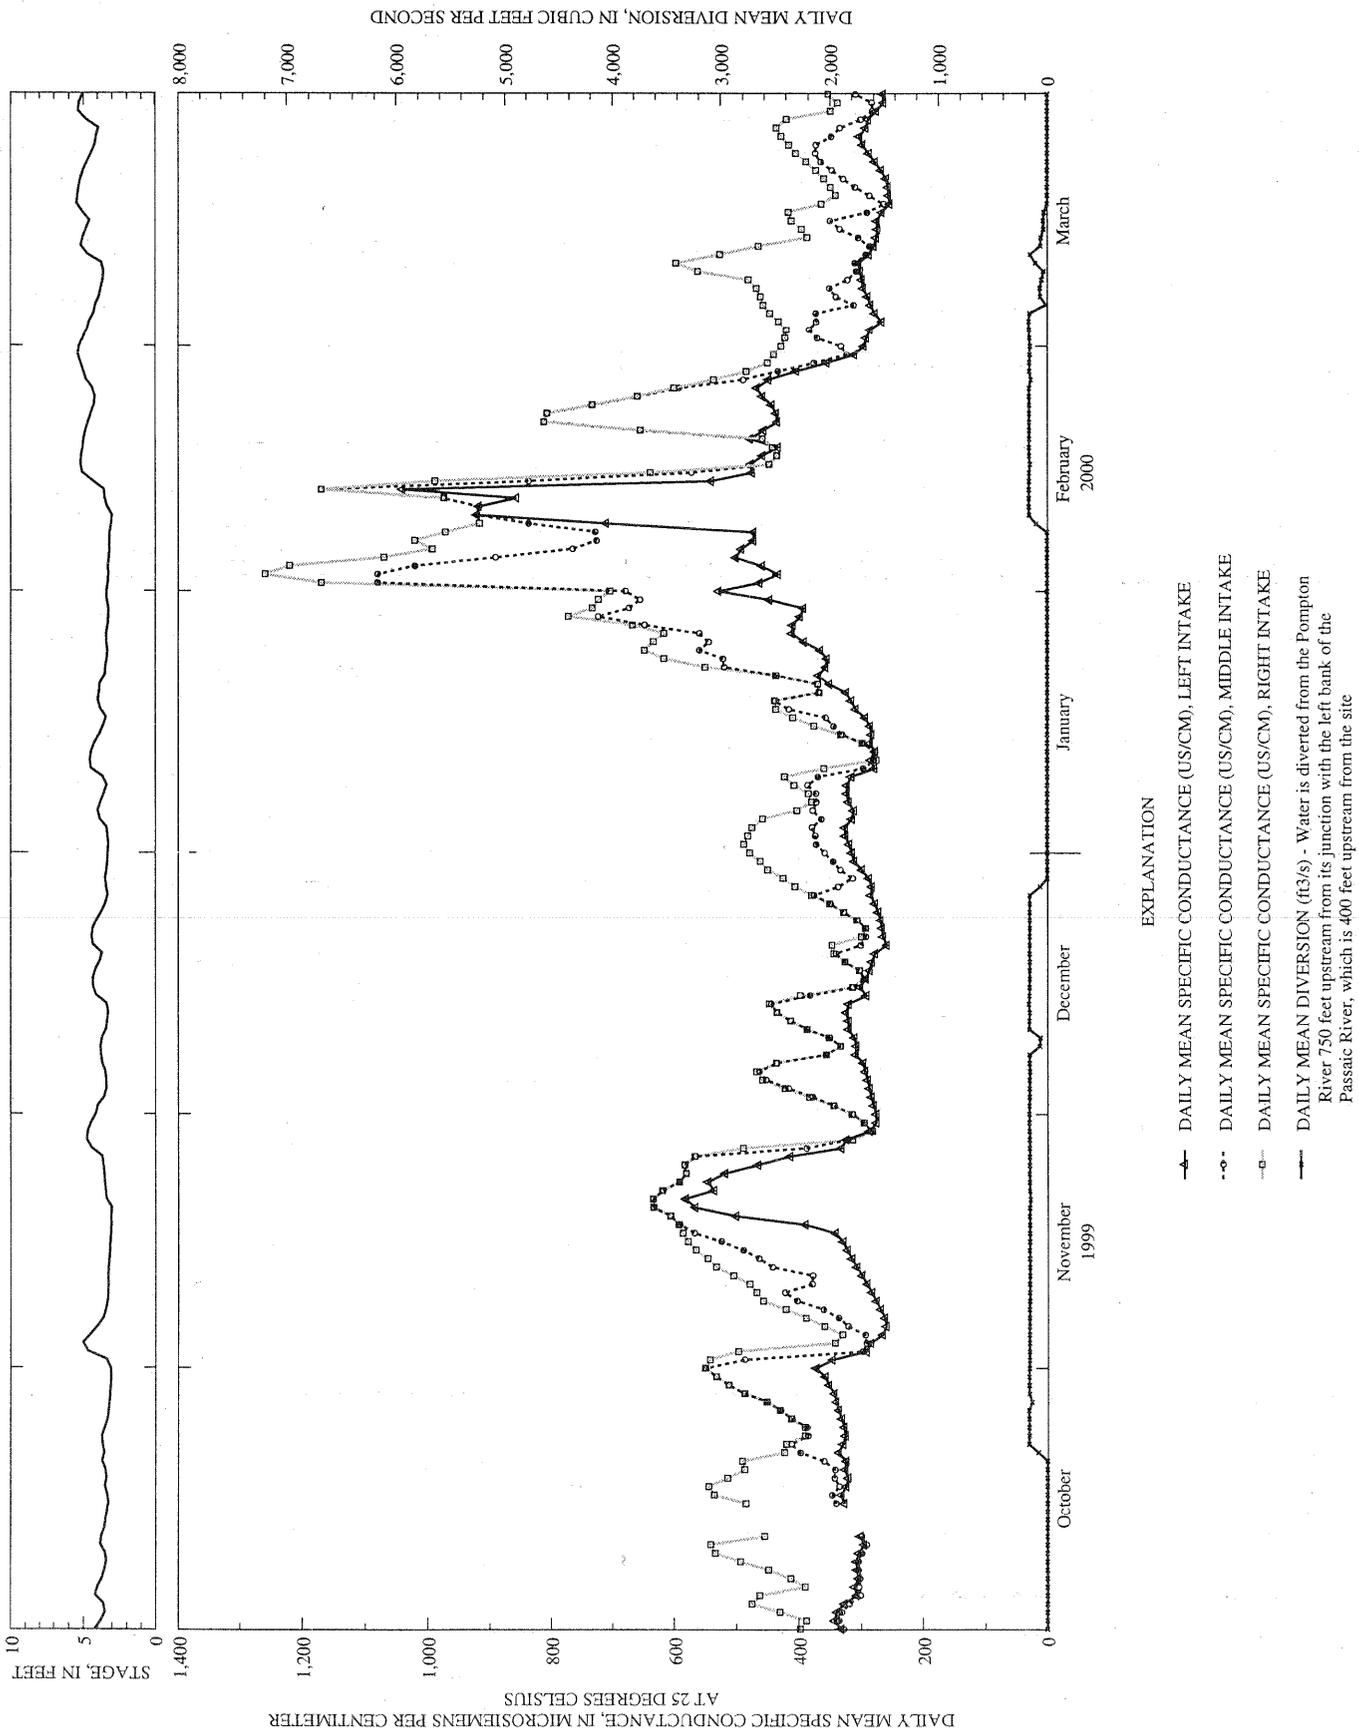

Figure 29a. Daily mean specific conductance, stage, and daily diversion at Passaic River below Pompton River at Two Bridges.

Daily mean specific conductance, stage, and diversion at the station, Passaic River below Pompton River at Two Bridges, NJ, April 1 to September 30, 2000.

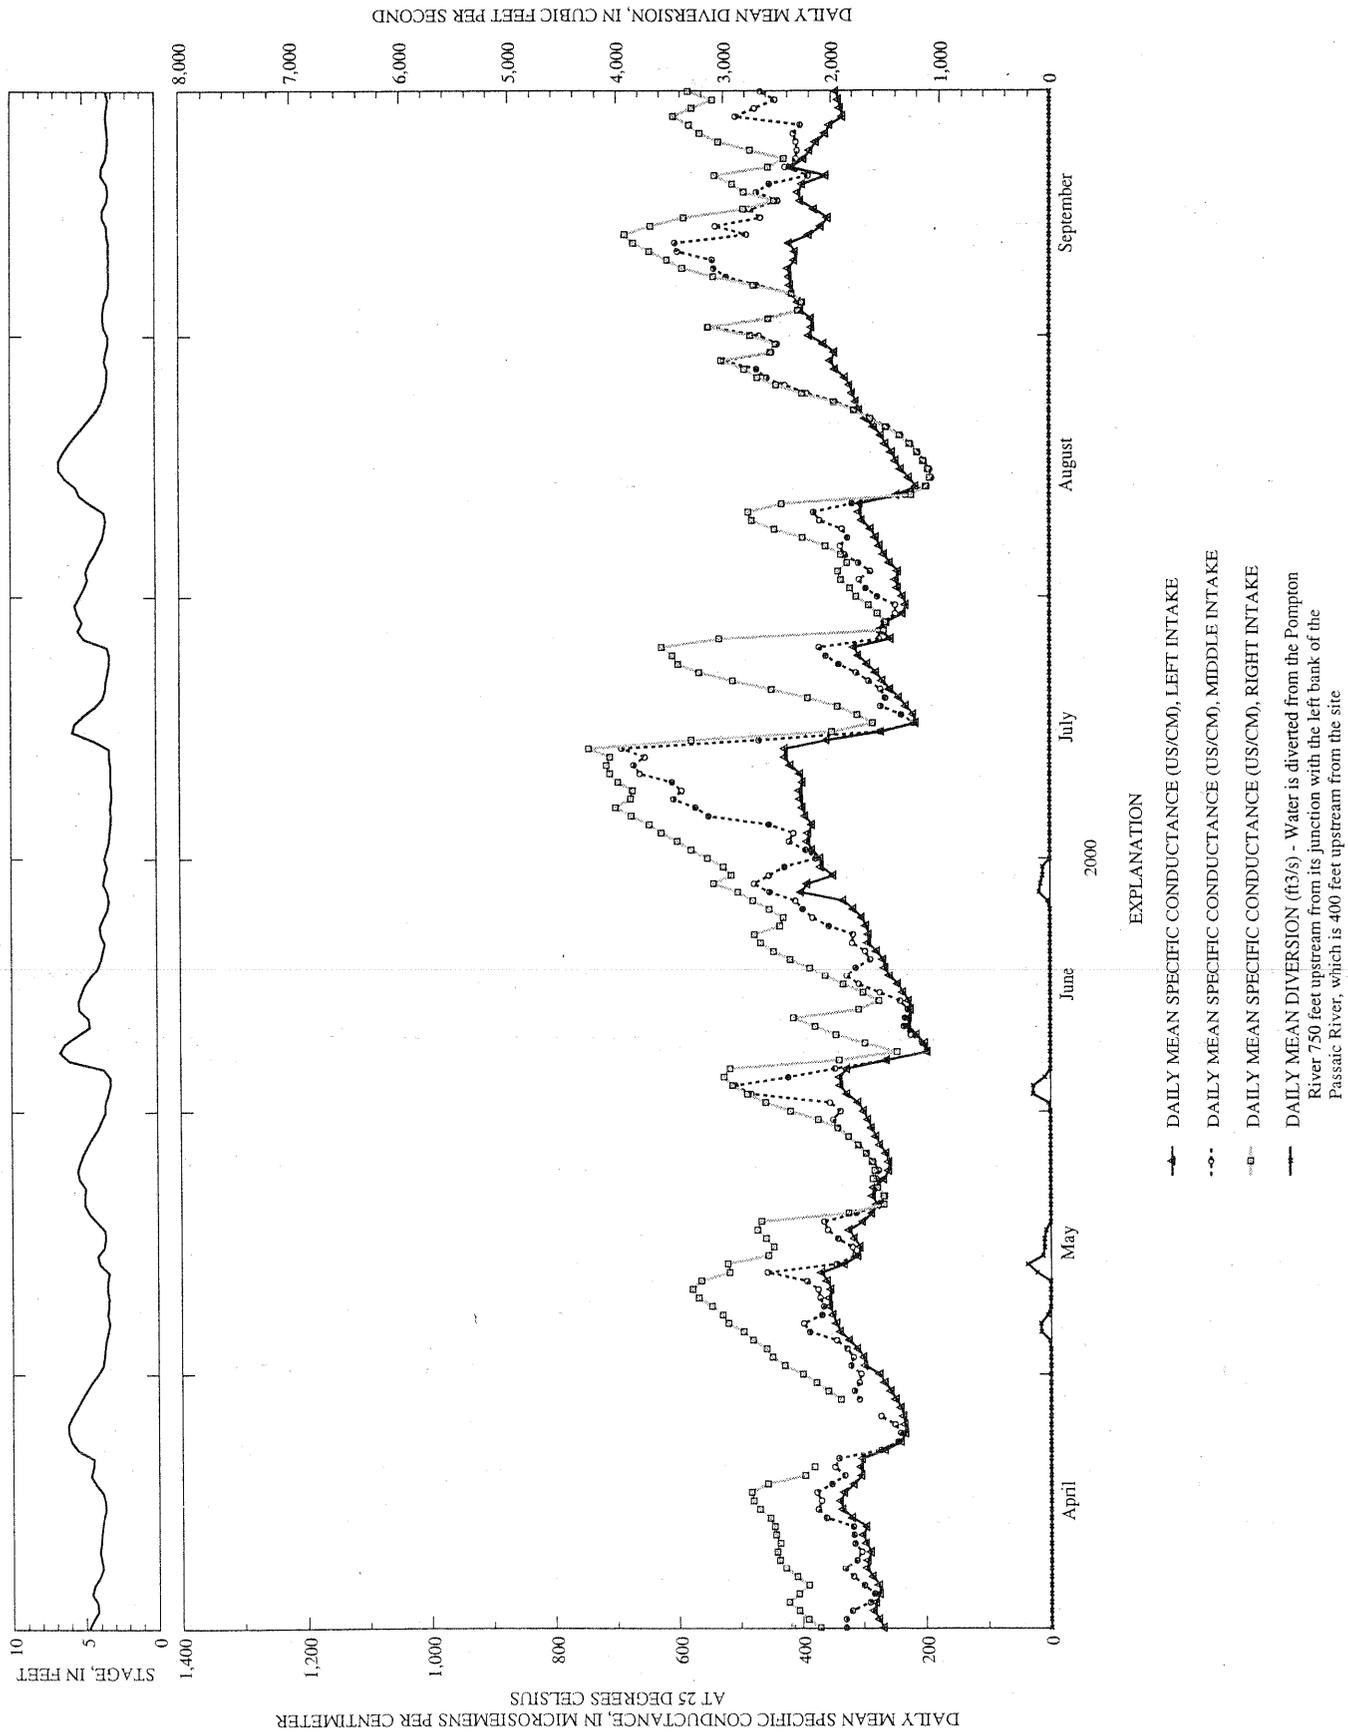

Figure 29b. Daily mean specific conductance, stage, and daily diversion at Passaic River below Pompton River at Two Bridges.

Cross section of specific conductance, water temperature, and dissolved oxygen concentration measurements (distance from left bank looking downstream); and recorded hourly specific conductance, water temperature, and dissolved oxygen concentration measurements from the water-quality monitor at the station, Passaic River below Pompton River at Two Bridges, NJ.

October 28, 1999

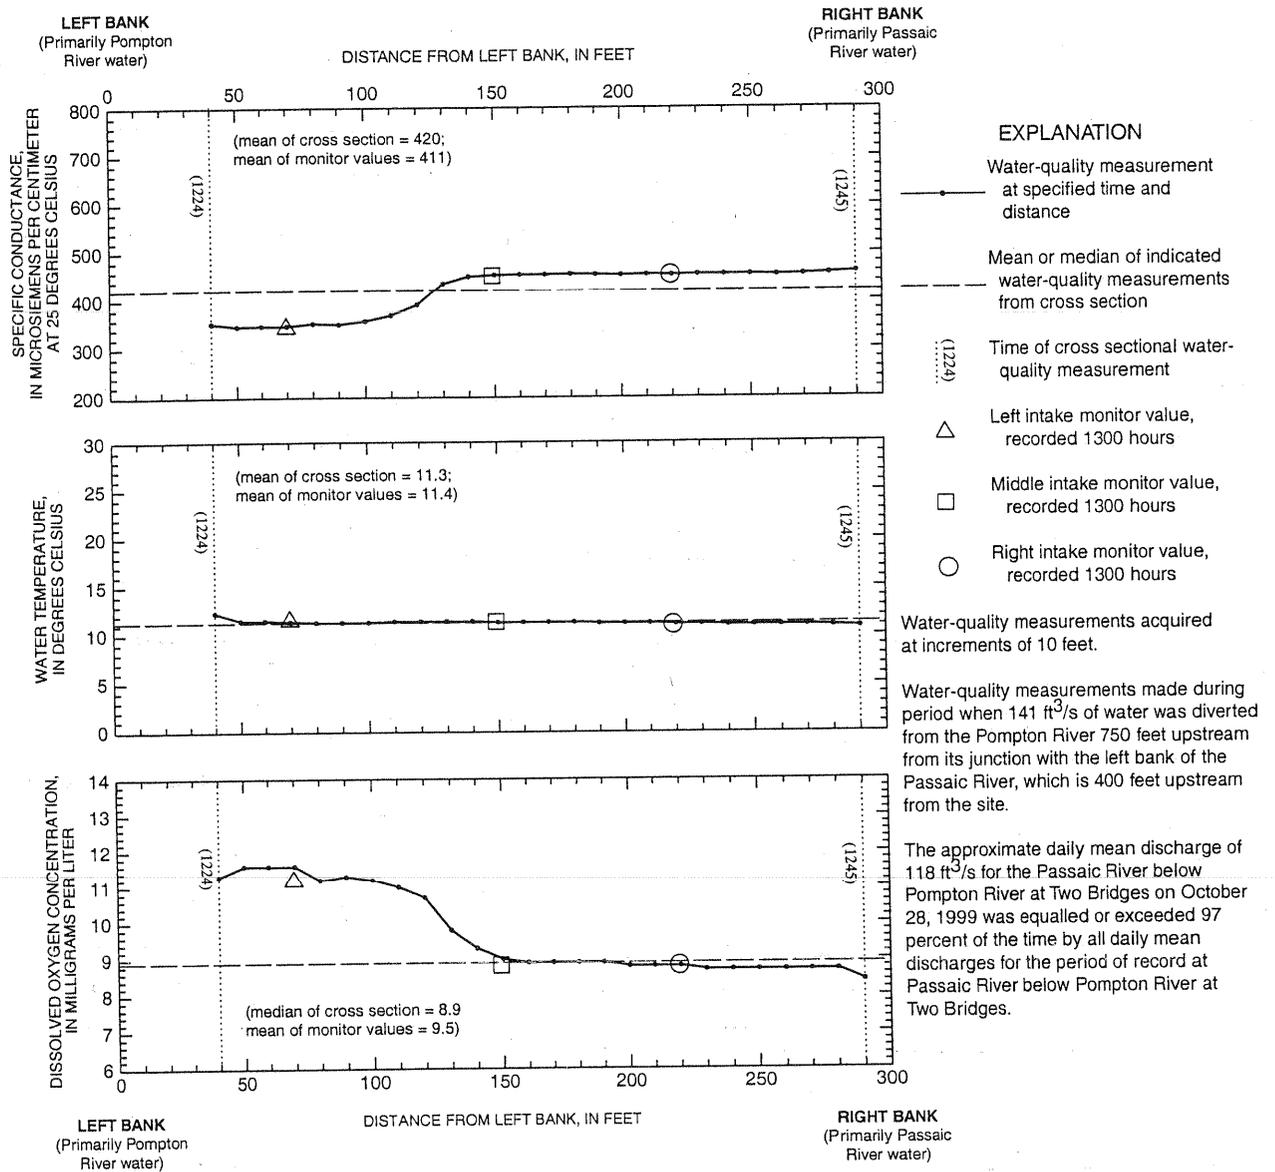

Figure 30. Cross sectional water-quality measurements with recorded monitor values, at Passaic River below Pompton River at Two Bridges, October 28, 1999.

Cross section of specific conductance, water temperature, and dissolved oxygen concentration measurements (distance from left bank looking downstream); and recorded hourly specific conductance, water temperature, and dissolved oxygen concentration measurements from the water-quality monitor at the station, Passaic River below Pompton River at Two Bridges, NJ.

July 14, 2000

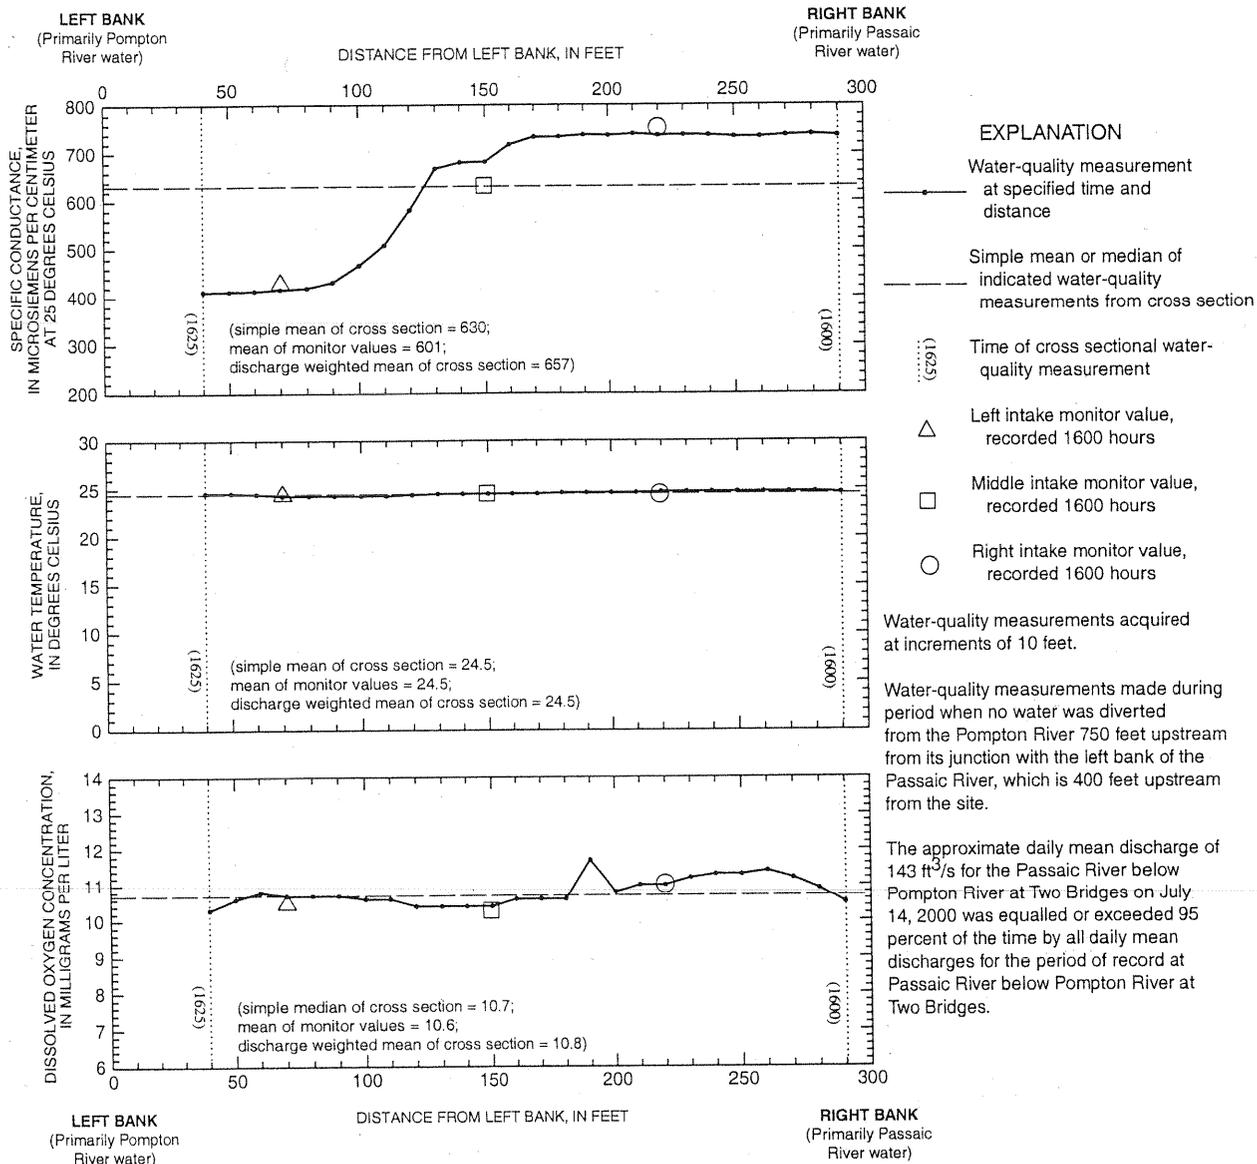

Figure 31. Cross sectional water-quality measurements with recorded monitor values, at Passaic River below Pompton River at Two Bridges, July 14, 2000.

PASSAIC RIVER BASIN

01389500 PASSAIC RIVER AT LITTLE FALLS, NJ

LOCATION.--Lat 40°53'05", long 74°13'35", Passaic County, Hydrologic Unit 02030103, on left bank 0.6 mi downstream from Beatties Dam in Little Falls, and 1.0 mi upstream from Peckman River.

DRAINAGE AREA.--762 mi².

PERIOD OF RECORD.--Water years 1963-96, 1998 to current year.

PERIOD OF DAILY RECORD.--

SPECIFIC CONDUCTANCE: October 1980 to November 1986.

WATER TEMPERATURE: Water years 1963 to 1980 (once daily), September 1980 to November 1986.

DISSOLVED OXYGEN: October 1970 to September 1980 (once daily).

SUSPENDED-SEDIMENT DISCHARGE: August 1963 to July 1965.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 4.

01390445 WEST BRANCH SADDLE RIVER AT UPPER SADDLE RIVER, NJ

LOCATION.--Lat 41°04'24", long 74°05'55", Bergen County, Hydrologic Unit 02030103, at bridge on Old Stone Church Road, 390 ft east of intersection of West Saddle River Road and Old Stone Church Road, and 0.3 mi downstream from Anona Lake in Upper Saddle River.

DRAINAGE AREA.--3.12 mi².

PERIOD OF RECORD.--November 1999 to August 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 4.

PASSAIC RIVER BASIN

01391500 SADDLE RIVER AT LODI, NJ

LOCATION.--Lat 40°53'25", long 74°04'51", Bergen County, Hydrologic Unit 02030103, on left bank 560 ft upstream from bridge on Outwater Lane in Lodi and 3.2 mi upstream from mouth. Water-quality samples collected at bridge on Outwater Lane at high flows.

DRAINAGE AREA.--54.6 mi².

PERIOD OF RECORD.--Water years 1962 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 4.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

RAHWAY RIVER BASIN

01396003 ROBINSONS BRANCH AT ST. GEORGES AVENUE AT RAHWAY, NJ

LOCATION.--Lat 40°36'38", long 74°17'11", Union County, Hydrologic Unit 02030104, at bridge on St. Georges Avenue, 0.4 mi south of the intersection of St. Georges Avenue, West Grand Avenue, and Westfield Avenue in Rahway, and 0.7 mi downstream of Milton Lake.

DRAINAGE AREA.--21.7 mi².

PERIOD OF RECORD.--December 1999 to September 2000.

REMARKS.--For definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria for the Environmental samples were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Analyses of the split and replicate samples were performed by the Laboratory Branch of the U.S. Environmental Protection Agency, Region II, Division of Environmental Science and Assessment.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 7.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

RARITAN RIVER BASIN

01396550 SPRUCE RUN AT NEWPORT, NJ

LOCATION.--Lat 40°43'29", long 74°54'34", Hunterdon County, Hydrologic Unit 02030105, at bridge on Newport Road, 1.2 mi northwest of Woodglen, and 6.4 mi upstream from Spruce Run Reservoir.

DRAINAGE AREA.--5.67 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Background and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 8.

RARITAN RIVER BASIN

01396660 MULHOCKAWAY CREEK AT VAN SYCKEL, NJ

LOCATION.--Lat 40°38'51", long 74°58'09", Hunterdon County, Hydrologic Unit 02030105, on left bank downstream side of bridge on Jutland Road, 0.2 mi south of Van Syckel, and 0.3 mi upstream from Spruce Run Reservoir, 0.8 mi north of Perryville.

DRAINAGE AREA.--11.8 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

PERIOD OF DAILY RECORD.--
WATER TEMPERATURE: April 1997 to August 1998.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 8.

RARITAN RIVER BASIN

01398000 NESHANIC RIVER AT REAVILLE, NJ

LOCATION.--Lat 40°28'22", long 74°49'40", Hunterdon County, Hydrologic Unit 02030105, on left bank 50 ft downstream from bridge on Everitts Road, 0.6 mi southwest of Reaville, 1.5 mi downstream from Third Neshanic River, and 2.2 mi upstream from Back Brook.

DRAINAGE AREA.--25.7 mi².

PERIOD OF RECORD.--Water years 1957, 1962, 1979 to current year.

PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: October 1997 to August 1998.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 8.

RARITAN RIVER BASIN

01398102 SOUTH BRANCH RARITAN RIVER AT SOUTH BRANCH, NJ

LOCATION.--Lat 40°32'48", long 74°41'48", Somerset County, Hydrologic Unit 02030105, at bridge on Studdiford Drive at South Branch, 0.8 mi upstream from mouth, and 2.7 mi southeast of Readington.

DRAINAGE AREA.--265 mi².

PERIOD OF RECORD.--Water years 1976-83, 1998 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 8.

RARITAN RIVER BASIN

01399780 LAMINGTON RIVER AT BURNT MILLS, NJ

LOCATION.--Lat 40°38'04", long 74°41'13", Somerset County, Hydrologic Unit 02030105, at bridge on Burnt Mills Road in Burnt Mills, 1,400 ft upstream from mouth, and 2.4 mi southwest of Greater Cross Roads.

DRAINAGE AREA.--100 mi².

PERIOD OF RECORD.--Water years 1964, 1976 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 8.

RARITAN RIVER BASIN

01400000 NORTH BRANCH RARITAN RIVER NEAR RARITAN, NJ

LOCATION.--Lat 40°34'10", long 74°40'45", Somerset County, Hydrologic Unit 02030105, on right bank, 400 ft upstream from U.S. Highway 202, 1.4 mi upstream from confluence with South Branch, and 2.7 mi west of Raritan.

DRAINAGE AREA.--190 mi².

PERIOD OF RECORD.--Water years 1923-25, 1960-76, 1978-80, 1997 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 8.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

RARITAN RIVER BASIN

01400640 MILLSTONE RIVER NEAR GROVERS MILL, NJ

LOCATION.--Lat 40°18'48", long 74°35'22", Mercer County, Hydrologic Unit 02030105, at bridge on Cranbury Road near Grovers Mill, 1.4 mi southeast of Plainsboro and 2.0 mi upstream from Cranbury Brook.

DRAINAGE AREA.--43.4 mi².

PERIOD OF RECORD.--Water years 1999 to current year. Site location was 01400650 during water years 1976-95, 1997-98.

REMARKS.--For definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria for the Environmental samples were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Analyses of the split and replicate samples were performed by the Laboratory Branch of the U.S. Environmental Protection Agency, Region II, Division of Environmental Science and Assessment.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 10.

RARITAN RIVER BASIN

01401200 DUCK POND RUN AT CLARKSVILLE, NJ

LOCATION.--Lat 40°18'24", long 74°40'06", Mercer County, Hydrologic Unit 02030105, at bridge on US Route 1, 0.5 mi upstream from Delaware and Raritan Canal, and 0.9 mi northeast of Clarksville.

DRAINAGE AREA.--5.21 mi².

PERIOD OF RECORD.--November 1999 to August 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 10.

RARITAN RIVER BASIN

01401400 HEATHCOTE BROOK AT KINGSTON, NJ

LOCATION.--Lat 40°22'10", long 74°36'59", Middlesex County, Hydrologic Unit 02030105, at bridge on Mapleton Road, at Penn Central Railroad bridge, 0.3 mi south of Kingston, and 0.4 mi upstream from mouth.

DRAINAGE AREA.--9.0 mi².

PERIOD OF RECORD.--Water years 1976-82, 1998 to current year.

REMARKS.--For the definitions of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria for the Environmental samples were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Analyses of the split and concurrent samples were performed by the Laboratory Branch of the U.S. Environmental Protection Agency, Region II, Division of Environmental Science and Assessment.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Mixed Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 10.

01403300 RARITAN RIVER AT QUEENS BRIDGE, AT BOUND BROOK, NJ

LOCATION.--Lat 40°33'34", long 74°31'41", Somerset County, Hydrologic Unit 02030105, at Queens Bridge on Main street in Bound Brook, 1.7 mi upstream from Fieldsville Dam.

DRAINAGE AREA.--804 mi².

PERIOD OF RECORD.--Water years 1964-69, 1971-73, 1978, 1981 to current year. Published as "at Bound Brook" (station 01403000) 1964-66, and as "below Calco Dam at Bound Brook" (station 01403060) 1967-69.

PERIOD OF DAILY RECORD.--
WATER TEMPERATURE: April 1997 to June 1998.

REMARKS.--Instantaneous discharges are determined at Raritan River below Calco Dam at Bound Brook (station 01403060). For the definitions of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Some field data and samples for laboratory analysis (12 of 16 samples) were collected as part of the LINJ NAWQA Study; field data and samples for laboratory analysis on 11/08, 02/08, 05/04, and 08/31 were provided by the New Jersey Department of Environmental Protection as part of the Ambient Stream Monitoring Program. Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, on those dates were performed by the New Jersey Department of Health, Public Health, and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--LINJ NAWQA and Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 9.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) using laboratory schedule 2020 (listed in its entirety, with minimum reporting levels, in the "Explanation of Records" section in the Introduction). The sample on 02/08 was analyzed by schedule 1307. Only VOCs identified by the analyses in one or more samples are listed in the following table.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	SAMPLE TYPE	ACETO- CHLOR, WATER, FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, DISS, REC, (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, DISS, REC (UG/L) (04028)	CAR- BARYL WATER FLTRD GF, REC (UG/L) (82680)

RARITAN RIVER BASIN

01403385 BOUND BROOK AT ROUTE 28, AT MIDDLESEX, NJ

LOCATION.--Lat 40°34'51", long 74°29'58", Middlesex County, Hydrologic Unit 02030105, at bridge on State Route 28, 0.3 mi upstream from Green Brook, 0.9 mi northeast of Middlesex, and 2.4 mi west of the intersection of State Route 28 and Washington Avenue in Dunellen.

DRAINAGE AREA.--23.9 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 9.

RARITAN RIVER BASIN

01405340 MANALAPAN BROOK AT FEDERAL ROAD, NEAR MANALAPAN, NJ

LOCATION.--Lat 40°17'46", long 74°23'53", Middlesex County, Hydrologic Unit 02030105, at bridge on Federal Road, 2.6 mi north of Manalapan, 3.1 mi southwest of Matchaponix, 3.3 mi downstream from Still House Brook, and 4.1 mi northeast of Applegarth.

DRAINAGE AREA.--20.9 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Mixed Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 9.

SHARK RIVER BASIN

01407720 JUMPING BROOK AT GREEN GROVE, NJ

LOCATION.--Lat 40°14'10", long 74°04'56", Monmouth County, Hydrologic Unit 02030104, at bridge on Essex Road, 160 ft southwest of intersection of Essex Road and Asbury Ave, 0.3 mi northwest of Green Grove, 0.3 mi southeast of Garden State Parkway, and 1.9 mi upstream of confluence with Hankins Brook.

DRAINAGE AREA.--2.58 mi².

PERIOD OF RECORD.--November 1999 to September 2000.

REMARKS.--For definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 12.

01407868 LONG BROOK AT WYCKOFF MILLS, NJ

LOCATION.--Lat 40°12'33", long 74°15'49", Monmouth County, Hydrologic Unit 02040301, at bridge on Strickland Road, 0.3 mi west of intersection with U.S. Route 9, 0.6 mi north of Wyckoff Mills, and 0.6 mi upstream of mouth and Manasquan River.

DRAINAGE AREA.--1.90 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 12.

01408009 MINGAMAHONE BROOK NEAR EARLE, NJ

LOCATION.--Lat 40°12'45", long 74°10'07", Monmouth County, Hydrologic Unit 02040301, at bridge on Cranberry Bog Road, 0.6 mi upstream from Branch Mingamahone Brook, and 1.7 mi west of Earle.

DRAINAGE AREA.--3.32 mi².

PERIOD OF RECORD.--Water years 1971-74, 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 12.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

01408500 TOMS RIVER NEAR TOMS RIVER, NJ

LOCATION.--Lat 39°59'10", long 74°13'29", Ocean County, Hydrologic Unit 02040301, New Jersey Department of Environmental Protection Watershed Management Area 13, on left bank 500 ft downstream from bridge on State Route 527 (Oak Ridge Parkway), 1.9 mi downstream from Union Branch, and 2.6 mi northwest of community of Toms River.

DRAINAGE AREA.--123 mi².

PERIOD OF RECORD.--Water years 1963 to current year.

PERIOD OF DAILY RECORD.--

SPECIFIC CONDUCTANCE: November 1974 to September 1981.

WATER TEMPERATURE: November 1963 to May 1966, November 1974 to September 1981.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 13.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO-CHLOR, WATER FLTRD REC (UG/L) (49260)	ALA-CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA-ZINE, WATER, DISS, REC (UG/L) (39632)	BEN-FLUR-ALIN, WAT FLD, GF, REC (UG/L) (82673)	BUTYL-ATE, WATER, DISS, REC (UG/L) (04028)	CAR-BARYL, WATER FLTRD, GF, REC (UG/L) (82680)	CARBO-FURAN, FLTRD, GF, REC (UG/L) (82674)	CHLOR-PYRIFOS, DIS-SOLVED (UG/L) (38933)	CYANA-ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA, WATER FLTRD, GF, REC (UG/L) (82682)	DEETHYL-ATRA-ZINE, WATER, DISS, REC (UG/L) (04040)

MULLICA RIVER BASIN

01409690 WEST BRANCH WADING RIVER AT CHATSWORTH, NJ

LOCATION.--Lat 39°48'51", long 74°32'50", Burlington County, Hydrologic Unit 02040301, at bridge on State Highway 532 in Chatsworth, 150 ft downstream from outlet of Chatsworth Lake, and 2.0 mi northwest of Dukes Bridge.

DRAINAGE AREA.--9.24 mi².

PERIOD OF RECORD.--Water years 1977 to 1978 and current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 14.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO-CHLOR	ALA-CHLOR	ATRA-ZINE	BEN-FLUR-ALIN	BUTYL-ATE	CAR-BARYL	CARBO-FURAN	CHLOR-PYRIFOS	CYANA-ZINE	DCPA-WATER	DEETHYL-ATRA-ZINE

01409815 WEST BRANCH WADING RIVER AT MAXWELL, NJ

LOCATION.--Lat 39°40'30", long 74°32'28", Burlington County, Hydrologic Unit 02040301, at bridge on State Highway 563 in Maxwell, 1.6 mi southeast of Washington, 1.8 mi southwest of Jenkins, and 2.2 mi upstream from confluence with Oswego River.

DRAINAGE AREA.--85.9 mi².

PERIOD OF RECORD.--Water years 1976-93, 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 14.

MULLICA RIVER BASIN

01410150 EAST BRANCH BASS RIVER NEAR NEW GRETNA, NJ

LOCATION.--Lat 39°37'23", long 74°26'30", Burlington County, Hydrologic Unit 02040301, on left bank upstream from bridge on Stage Road, 0.7 mi west of Lake Absegami, 2.2 mi north of New Gretna, and 5.3 mi upstream from mouth.

DRAINAGE AREA.--8.11 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Management Area 14..

01411035 HOSPITALITY BRANCH AT BLUE BELL ROAD NEAR CECIL, NJ

LOCATION.--Lat 39°38'36", long 74°58'40", Gloucester County, Hydrologic Unit 02040302, at bridge on Blue Bell Road, 1.2 mi upstream of Timber Lakes and 2.0 mi west of Cecil.

DRAINAGE AREA.--4.51 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--For definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Mixed Land Use Indicator and Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 15.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

01411050 HOSPITALITY BRANCH NEAR CECIL, NJ

LOCATION.--Lat 39°37'14", long 74°55'39", Gloucester County, Hydrologic Unit 02040302, at bridge on Coles Mills Road (County Route 538). 0.3 mi south of intersection of Coles Mills Road and U.S. Route 322, 0.5 mi upstream of Diamond Lake, and 2.2 mi southeast of Cecil.

DRAINAGE AREA.--14.2 mi².

PERIOD OF RECORD.--December 1999 to September 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 15.

01411110 GREAT EGG HARBOR RIVER AT WEYMOUTH, NJ

LOCATION.--Lat 39°30'50", long 74°46'47", Atlantic County, Hydrologic Unit 02040302, at bridge on U.S. Route 322 in Weymouth, 0.5 mi upstream from Deep Run, and 20.9 mi upstream from mouth.

DRAINAGE AREA.--154 mi².

PERIOD OF RECORD.--Water years 1975 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 15.

01411428 DENNIS CREEK TRIBUTARY 2 AT DENNISVILLE, NJ

LOCATION.--Lat 39°11'34", long 74°49'33", Cape May County, Hydrologic Unit 02040206, at outlet of Johnson Pond, on State Route 47, and 0.1 mi west of Dennisville.

DRAINAGE AREA.--4.00 mi².

PERIOD OF RECORD.--December 1999 to September 2000.

REMARKS.--For definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 16.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO- CHLOR, WATER FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, DISS, REC, (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC, (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, DISS, GF, REC (UG/L) (04028)	CAR- BARYL WATER, FLTRD 0.7 U GF, REC (UG/L) (82680)	CARBO- FURAN WATER FLTRD 0.7 U GF, REC (UG/L) (82674)	CHLOR- PYRIFOS WATER, DIS- SOLVED REC (UG/L) (38933)	CYANA- ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER FLTRD 0.7 U GF, REC (UG/L) (82682)	DEETHYL ATRA- ZINE, WATER, DISS, REC (UG/L) (04040)

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO- CHLOR, WATER, FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD 0.7 U GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, DISS, REC (UG/L) (04028)	CAR- BARYL WATER FLTRD GF, REC (UG/L) (82680)	CARBO- FURAN WATER FLTRD GF, REC (UG/L) (82674)	CHLOR- PYRIFOS DIS- SOLVED (UG/L) (38933)	CYANA- ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER FLTRD GF, REC (UG/L) (82682)	DEETHYL ATRA- ZINE, WATER, DISS, REC (UG/L) (04040)

MAURICE RIVER BASIN

01411955 GRAVELLY RUN AT LAUREL LAKE, NJ

LOCATION.--Lat 39°20'14", long 75°03'04", Cumberland County, Hydrologic Unit 02040206, 0.3 mi upstream from mouth and Buckshutem Creek, 1.1 mi west of community of Laurel Lake, and 2.5 mi southeast of Millville Municipal Airport.

DRAINAGE AREA.--3.19 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--For the definitions of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction. Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved nitrite, total ammonia, dissolved ammonia, and BOD were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Background and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 17.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

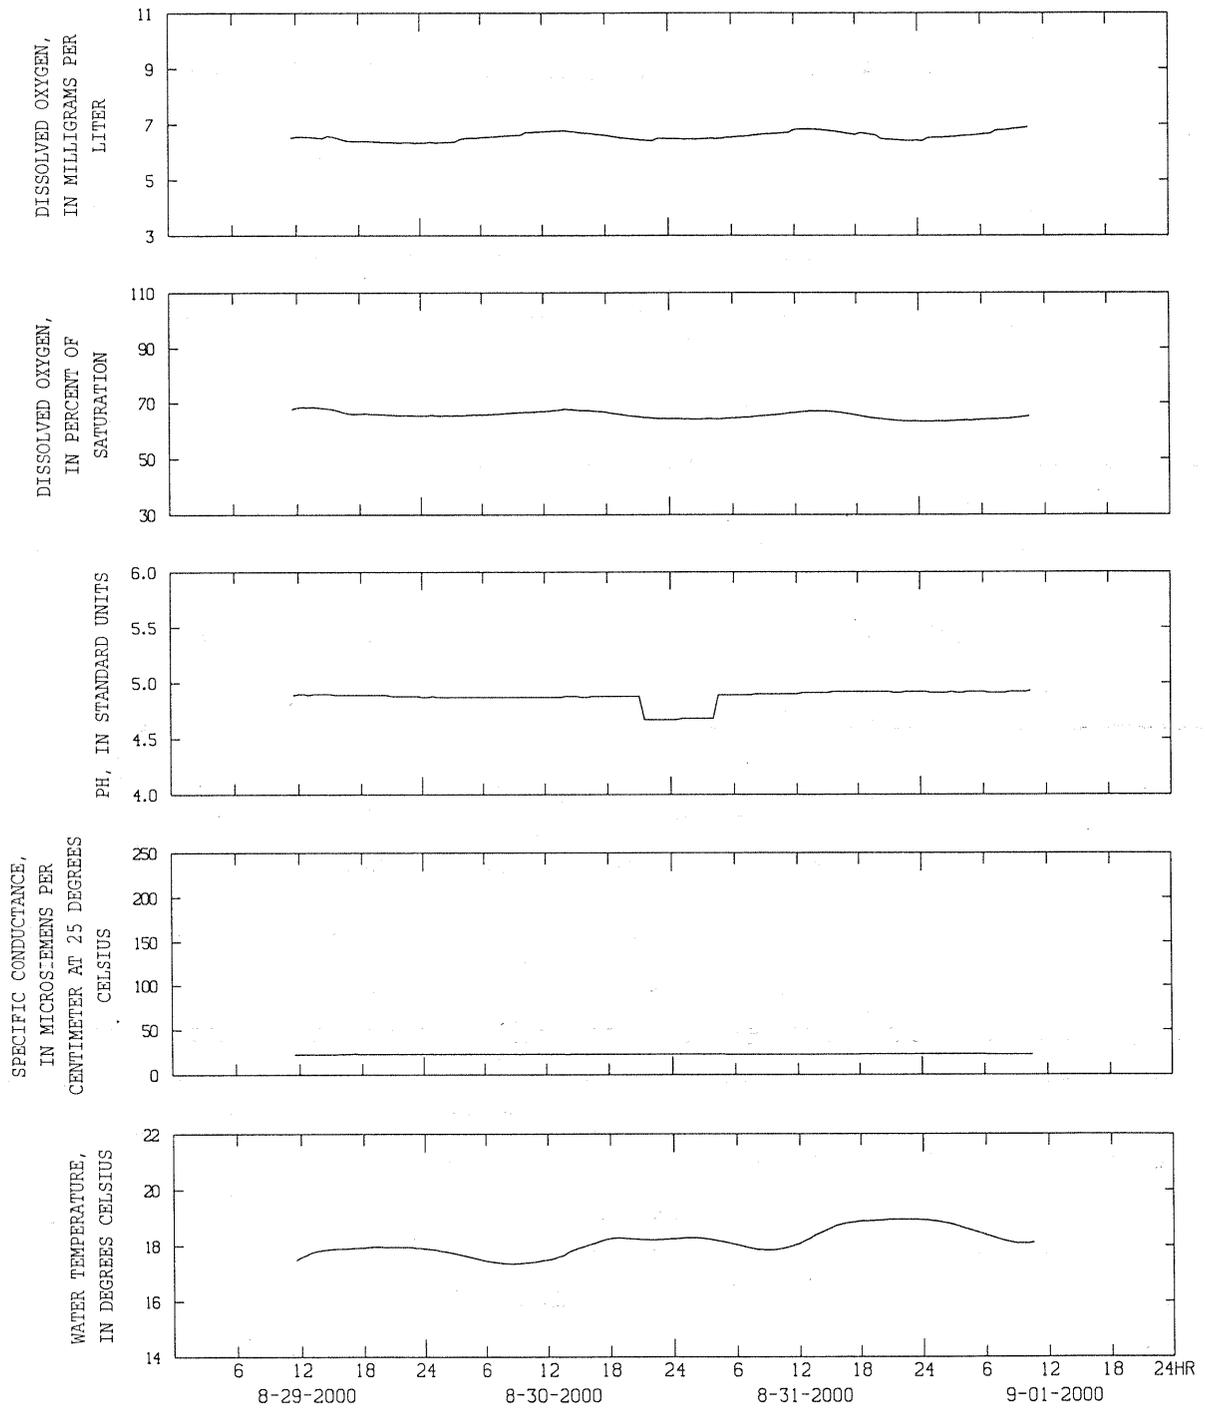

Figure 35. Reconnaissance Study -- Field characteristics and concentrations of constituents in surface water monitored at 01411955 Gravelly Run at Laurel Lake.

NANTUXENT CREEK BASIN

01412200 PAGES RUN AT NEWPORT, NJ

LOCATION.--Lat 39°18'18", long 75°09'52", Cumberland County, Hydrologic Unit 02040206, at bridge on County Highway 553, 0.1 mi north of Frames Corner, 0.6 mi downstream of Shaws Mill Pond, and 0.9 mi northeast of Newport.

DRAINAGE AREA.--3.86 mi².

PERIOD OF RECORD.--December 1999 to August 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 17.

01412800 COHANSEY RIVER AT SEELEY, NJ

LOCATION.--Lat 39°28'21", long 75°15'21", Cumberland County, Hydrologic Unit 02040206, on right bank just downstream from bridge on Silver Lake Road, 0.6 mi south of Seeley, 2.6 mi east of Shiloh, 4.1 mi north of Bridgeton, and 22.5 mi upstream from mouth.

DRAINAGE AREA.--28.0 mi².

PERIOD OF RECORD.--Water years 1975 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 17.

01413065 CANTON DRAIN AT MASKELLS MILL, NJ

LOCATION.--Lat 39°29'09", long 75°23'59", Salem County, Hydrologic Unit 02040206, at bridge on Maskells Mill Road at Maskells Mill, 100 ft downstream from outlet of Maskells Mill Pond, 1.3 mi northeast of Canton, and 2.2 mi southeast of Hammersville.

DRAINAGE AREA.--6.53 mi².

PERIOD OF RECORD.--December 1999 to September 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 17.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

01434000 DELAWARE RIVER AT PORT JERVIS,

LOCATION.--Lat 41°22'14", long 74°41'52", Pike County, PA, Hydrologic Unit 02040104, on right bank 250 ft downstream from bridge (on U.S. Highways 6 and 209) between Port Jervis, NY and Matamoras, PA, 1.2 mi upstream from Neversink River, and 6.5 mi downstream from Mongaup River.

DRAINAGE AREA.--3,070 mi².

PERIOD OF RECORD.--Water years 1957-60, 1964 to January 1994, June 1997, 1999 to current year.

CHEMICAL DATA: 1958-59 (a), 1964-65 (c), 1966 (a), 1967-68 (c), 1969-76 (d), 1987 (b), 1988-89 (c), 1990-91 (b), 1992, 1997 (a), 1999 to current year (d).

MINOR ELEMENTS DATA: 1970, 1972-73 (a), 1974-76 (c), 1987 (b), 1988-89 (c), 1990-91 (b), 1992 (a).

PESTICIDE DATA: 1974 (a), 1987 (b), 1988-89 (c), 1990 (b), 1997 (a), 1999 to current year (d).

ORGANIC DATA: OC--1974 (b), 1975 (d), 1999 to current year (d).

NUTRIENT DATA: 1968 (a), 1969-76 (d), 1987 (b), 1988-89 (c), 1990 (b), 1999 to current year (d).

BIOLOGICAL DATA:

Bacteria--1973-76 (d).

Phytoplankton--1974 (b), 1975-76 (c).

Periphyton--1976 (a).

SEDIMENT DATA: 1959, 1976 (c), 1988 (b), 1989 (c), 1990-91 (b), 1992 (a), 1999 to current year (d).

PERIOD OF DAILY RECORD.--

SPECIFIC CONDUCTANCE: January to September 1973.

SUSPENDED-SEDIMENT DISCHARGE: February 1957 to September 1960, March 1970 to June 1976.

WATER TEMPERATURE: February 1957 to September 1960, January to September 1973, June 1974 to January 1994, October 1998 to current year.

INSTRUMENTATION.-- Thermocoupler to data logger; recorded every 15 minutes.

REMARKS.--These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

Interruptions in the daily record were due to instrument malfunction. For the definition of the type of quality-control data listed under SAMPLE TYPE, refer to "Quality-Control Data" in the "Explanation of Records" section in the Introduction.

EXTREMES FOR PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: Maximum (water years 1957-59, 1973-81, 1983-84, 1988- 93, 1999-2000), 30.5 °C, July 5, 1999; minimum (water years 1958-60, 1973, 1975-93, 1999-2000), 0.0°C on many days during winter periods, except 1984.

SUSPENDED-SEDIMENT CONCENTRATION (water years 1957-60, 1970-76): Maximum daily mean, 760 mg/L, June 29, 1973; minimum daily mean, less than 1 mg/L on many days.

SUSPENDED-SEDIMENT DISCHARGE (water years 1957-60, 1970-76): Maximum daily, 187,000 tons, June 29, 1973; minimum daily, 1 ton, Aug. 29, 1957.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

01435000 NEVERSINK RIVER NEAR CLARYVILLE, NY

LOCATION.--Lat 41°53'24", long 74°35'25", Sullivan County, Hydrologic Unit 02040104, on left bank 50 ft downstream from covered bridge, 300 ft upstream from small tributary, 2.2 mi downstream from confluence of East and West Branches, and 2.2 mi southwest of Claryville.

DRAINAGE AREA.--66.6 mi².

PERIOD OF RECORD.-- Water years 1965-66, 1969, 1971, 1973-75, 1985-87, June 1998, May 1999 - current year.

CHEMICAL DATA: 1965 (a), 1966 (b), 1969, 1971 (a), 1973-75 (b), 1985 (a), 1986 (b), 1987 (c), May 1999 - current year (a).
 NUTRIENT DATA: 1985 (a), 1986 (b), 1987 (c), 1998 (e), May 1999 - current year (a).

REMARKS.--These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO-CHLOR, WATER FLTRD REC (UG/L) (49260)	ALA-CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA-ZINE, WATER, DISS, REC (UG/L) (39632)	BEN-FLUR-ALIN WAT FLD 0.7 U GF, REC (UG/L) (82673)	BUTYL-ATE, WATER, DISS, REC (UG/L) (04028)	CAR-BARYL WATER FLTRD 0.7 U GF, REC (UG/L) (82680)	CARBO-FURAN WATER FLTRD 0.7 U GF, REC (UG/L) (82674)	CHLOR-PYRIFOS DIS-SOLVED (UG/L) (38933)	CYANA-ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER, FLTRD 0.7 U GF, REC (UG/L) (82682)	DEETHYL ATRA-ZINE, WATER, DISS, REC (UG/L) (04040)

01438500 DELAWARE RIVER AT MONTAGUE, NJ

LOCATION.--Lat 41°18'33", long 74°47'44", Pike County, PA, Hydrologic Unit 02040104, on right bank 1,500 ft upstream from toll bridge (on U.S. Route 206) between Montague, NJ and Milford, PA, 0.8 mi downstream from Sawkill Creek, and at river mile 246.3.

DRAINAGE AREA.--3,480 mi².

PERIOD OF RECORD.--Water years 1956-73, 1976-78, July 1991 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.-- Delaware River Main Stem, New Jersey Department of Environmental Protection Watershed Management Area 1.

01440000 FLAT BROOK NEAR FLATBROOKVILLE, NJ

LOCATION.--Lat 41°06'24", long 74°57'09", Sussex County, Hydrologic Unit 02040104, on right bank 1.0 mi upstream from Flatbrookville, and 1.5 mi upstream from mouth.

DRAINAGE AREA.--64.0 mi².

PERIOD OF RECORD.--Water years 1923-24, 1956-57, 1959-80, 1993, 1995, 1997 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction. Fish community data for this site and other sites are presented in Water-Quality at Miscellaneous Sites.

COOPERATION.--Field measurements and samples for laboratory analysis on Dec. 2, Feb. 9, May 23, and Aug. 1, were provided by the New Jersey Department of Environmental Protection. Determinations of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. Coli, and enterococci bacteria on those dates were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Other field data and samples for laboratory analysis were provided by the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 1.

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DELAWARE RIVER BASIN

01443000 DELAWARE RIVER AT PORTLAND, PA

LOCATION.--Lat 40°55'26", long 75°05'46", Northampton County, Hydrologic Unit 02040105, at walkbridge connecting Portland, PA and Columbia, NJ, and 0.5 mi upstream from Paulins Kill.

DRAINAGE AREA.--4,165 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Delaware River Main Stem, New Jersey Department of Environmental Protection Watershed Management Area 1.

01443500 PAULINS KILL AT BLAIRSTOWN, NJ

LOCATION.--Lat 40°58'44", long 74°57'15", Warren County, Hydrologic Unit 02040105, on right bank 1,200 ft upstream from bridge on State Highway 94 in Blairstown, 1,400 ft upstream from Blairs Creek, and 10 mi upstream from mouth. Water-quality samples collected at bridge, 1,200 ft downstream from gage, at high flows.

DRAINAGE AREA.--126 mi².

PERIOD OF RECORD.--Water years 1921, 1925, 1957-60, 1962-63, 1976 to current year.

REMARKS.--Field data and samples for laboratory analysis on 05/31 were provided by the Delaware River Basin National Water Quality Assessment Program (DELR NAWQA). Additional water quality data collected as part of DELR NAWQA synoptic study are listed in the section "Water Quality and Miscellaneous Sites."

COOPERATION.--Field data and samples for laboratory analyses on 11/09, 02/07, 05/16, and 09/14 were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Other field data and samples for laboratory analysis were provided by the DELR NAWQA.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 1.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

01446400 PEQUEST RIVER AT BELVIDERE, NJ

LOCATION.--Lat 40°49'45", long 75°04'44", Warren County, Hydrologic Unit 02040105, at last highway bridge before mouth, and 0.3 mi upstream from mouth.

DRAINAGE AREA.--158 mi².

PERIOD OF RECORD.--Water years 1957, 1962, 1976-82, 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 1.

01451800 JORDAN CREEK NEAR SCHNECKSVILLE, PA

LOCATION.--Lat 40°39'42", long 75°37'38", Lehigh County, PA, Hydrologic Unit 02040106, on left bank 54 ft downstream from wooden covered bridge at Trexler-Lehigh County Game Preserve, 1.0 mi downstream from Mill Creek, and 1.1 mi southwest of Schnecksville.

DRAINAGE AREA.--53.0 mi².

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA). Fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites.

PERIOD OF RECORD.--Water years 1996 to current year.

PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: May 1999 to June 1999.

INSTRUMENTATION.--Water-temperature data logger (in-situ system; measurements recorded every 15 or 30 minutes), located 50 ft downstream from bridge.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

< Actual value is known to be less than the value shown.

01454700 LEHIGH RIVER AT GLENDON, PA

LOCATION.--Lat 40°40'09", long 75°14'12", Northampton County, PA, Hydrologic Unit 02040106, on right bank 140 ft upstream from highway bridge in Hugh Moore Parkway at Glendon, 1.9 mi upstream from mouth and 2.0 mi southeast of Easton.

DRAINAGE AREA.--1,359 mi².

PERIOD OF RECORD.--October 1966 to current year.

INSTRUMENTATION.--Water-temperature data logger (in-situ system; measurements recorded every 15 or 30 minutes) located 10 ft upstream from bridge.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction.

PERIOD OF DAILY RECORD.--
WATER TEMPERATURE: October 1998 to April 1999.

EXTREMES FOR PERIOD OF DAILY RECORD.--
WATER TEMPERATURE: maximum, 12.0 °C, Apr. 3, 4, 5, 1999, but may have been higher during period of missing record; minimum, -1.0 °C, Feb. 24, but may have been lower during period of missing record.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	SAMPLE TYPE	ACETO- CHLOR, WATER, FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, REC, (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, REC (UG/L) (04028)	CAR- BARYL WATER, FLTRD 0.7 U GF, REC (UG/L) (82680)

01457400 MUSCONETCONG RIVER AT RIEGELSVILLE, NJ

LOCATION.--Lat 40°35'32", long 75°11'20", Warren County, Hydrologic Unit 02040105, at bridge on State Highway 13 in Riegelsville, 0.2 mi north of Mount Joy, and 0.2 mi upstream from mouth.

DRAINAGE AREA.--156 mi².

PERIOD OF RECORD.--Water years 1962, 1976 to current year.

REMARKS.--Water-quality samples do not include Riegelsville Paper Company bypass.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 1.

01457500 DELAWARE RIVER AT RIEGELSVILLE, NJ

LOCATION.--Lat 40°35'36", long 75°11'17", Warren County, Hydrologic Unit 02040105, just upstream from suspension bridge at Riegelsville, 600 ft upstream from Musconetcong River (flow of which is included in the records for this station since Oct.1, 1931). Water-quality samples are collected from the bridge and do not include flow of the Musconetcong River.

DRAINAGE AREA.--6,328 mi².

PERIOD OF RECORD.--Water years 1934, 1943, 1950, 1960-79, 1991 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Delaware River Main Stem, New Jersey Department of Environmental Protection Watershed Management Area 11.

01461000 DELAWARE RIVER AT LUMBERVILLE, PA

LOCATION.--Lat 40°24'27", long 75°02'16", Bucks County, Hydrologic Unit 02040105, at pedestrian bridge at Lumberville, 1.4 mi upstream from Lockatong Creek.

DRAINAGE AREA.--6,598 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Delaware River Main Stem, New Jersey Department of Environmental Protection Watershed Management Area 11.

01463500 DELAWARE RIVER AT TRENTON, NJ

LOCATION.--Lat 40°13'18", long 74°46'42", Mercer County, Hydrologic Unit 02040105, New Jersey Department of Environmental Protection Watershed Management Area 11, on left bank 450 ft upstream from Calhoun Street Bridge at Trenton, 0.5 mi upstream from Assunpink Creek, and at mile 134.5.

DRAINAGE AREA.--6,780 mi².

PERIOD OF RECORD.--October 1944 to current year.

PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: October 1962 to current year. Recorded as once daily during 1979.

pH: June 1968 to current year. Recorded as once daily during 1979.

SPECIFIC CONDUCTANCE: October 1963 to current year. Recorded as once daily during years 1964 to 1968, 1979.

SUSPENDED SEDIMENT DISCHARGE: September 1949 to September 1981.

WATER TEMPERATURE: October 1944 to current year. Recorded as once daily during years 1945 to 1953, 1962, 1964, 1979.

TURBIDITY: November 1999 to September 2000.

INSTRUMENTATION.--

TEMPERATURE MONITOR (graphic recorder at gage house, in situ system):

October 1953 to September 1961.

TEMPERATURE / DISSOLVED-OXYGEN MONITOR:

October 1962 to September 1965: graphic recorder; only dissolved-oxygen concentration recorded during water year 1964.

October 1965 to May 1968: digital recorder.

WATER-QUALITY MONITOR (continuous pumping system, measurements recorded hourly):

June 1968 to August 1975: water withdrawn from raw-water intake within Trenton Water Filtration Plant, Trenton, NJ.

November 1975 to November 1978: water withdrawn from river through PVC pipe to gage house outside Trenton Water Filtration Plant, Trenton, NJ.

December 1979 to September 1986: water withdrawn from raw-water intake within Trenton Water Filtration Plant, Trenton, NJ.

WATER-QUALITY MONITOR (in situ system, measurements recorded hourly):

October 1986 to September 1995: probes located inside raw-water intake of Trenton Water Filtration Plant, Trenton, NJ.

October 1995 to current year: monitor suspended within stilling well of Morrisville Water Filtration Plant, Morrisville, PA., 1600 feet upstream from the gage house.

REMARKS.--Nutrient samples on Nov. 29 at 1101, Mar. 09 at 1201, May 26 at 0911, and Aug. 28 at 1041 were collected to fulfill the requirements of the Ambient Stream Monitoring Program. Missing continuous water-quality records are the result of instrument malfunction or interruption of flow through the filtration plant. Unpublished records of suspended-sediment discharge for the period Oct. 1, 1981, to Mar. 31, 1982, are available at the U.S. Geological Survey Office in West Trenton, NJ. For the definitions of the type of quality-control data listed under SAMPLE TYPE, refer to "Quality-control data" in the "Explanation of Records" section. Beginning October, 1999, pH daily value tables will report maximum, minimum and median values.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. Coli, enterococci bacteria, and dissolved hexavalent chromium on Nov. 29 at 1102, Mar. 09 at 1202, May 26 at 0912, and Aug. 28 at 1042 were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Samples were collected in conjunction with those for the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

EXTREMES FOR PERIOD OF DAILY RECORD.--

DISSOLVED OXYGEN: maximum, 20.0 mg/L, Feb. 11, 1989; minimum, 4.0 mg/L, Nov. 9, 1972, Sept. 9, 1995.

pH: maximum, 10.3, Aug. 9, 10, 1983; minimum 5.3, June 22, 1972.

SPECIFIC CONDUCTANCE: maximum, 468 uS/cm, Jan. 11, 1999; minimum, 63 uS/cm, July 7, 1984.

WATER TEMPERATURE: maximum, 34.0°C, June 18, 1957; minimum -0.6°C, on many days during winter months in water years 1954-57.

TURBIDITY: maximum, 460 ntu, May 19, 2000; minimum, 0 ntu, on many days in water year 2000.

EXTREMES FOR CURRENT YEAR.--

DISSOLVED OXYGEN: Maximum, 15.7 mg/L, Feb. 10; minimum, 6.4 mg/L, Sept. 17.

pH: Maximum, 9.1 units, Oct. 31, Nov. 1, July 12; minimum, 6.7 units, May 2.

SPECIFIC CONDUCTANCE: Maximum, 253 microsiemens/cm, Sept. 15; minimum, 93 microsiemens/cm, June 9.

WATER TEMPERATURE: Maximum, 27.0°C, Aug. 10, Sept. 2-4; minimum, 0.0°C, on many days during January and February.

TURBIDITY: Maximum, 460 ntu, May 19; minimum, 0 ntu, on many days.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) using laboratory schedule 2020 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the following table.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DATE	TIME	ACETO- CHLOR, WATER FLTRD REC (UG/L) (49260)	ALA- CHLOR, WATER, DISS, REC, (UG/L) (46342)	ATRA- ZINE, WATER, DISS, REC (UG/L) (39632)	BEN- FLUR- ALIN WAT FLD GF, REC (UG/L) (82673)	BUTYL- ATE, WATER, DISS, REC (UG/L) (04028)	CAR- BARYL- WATER FLTRD GF, REC (UG/L) (82680)	CARBO- FURAN WATER FLTRD GF, REC (UG/L) (82674)	CHLOR- PYRIFOS DIS- SOLVED (UG/L) (38933)	CYANA- ZINE, WATER, DISS, REC (UG/L) (04041)	DCPA WATER FLTRD GF, REC (UG/L) (82682)	DEETHYL ATRA- ZINE, WATER, DISS, REC (UG/L) (04040)

01463500 DELAWARE RIVER AT TRENTON, NJ--Continued

(Yearly hydrographs of daily mean values from the water-quality monitor)

DELAWARE RIVER BASIN

01463500 DELAWARE RIVER AT TRENTON, NJ--Continued

(Yearly hydrographs of daily mean values from the water-quality monitor)

Cross section of specific conductance, pH, water temperature, turbidity, and dissolved oxygen concentration measurements from the Calhoun Street Bridge (distance from left bank looking downstream); and recorded hourly specific conductance, pH, water temperature, turbidity, and dissolved oxygen concentration measurements from the water-quality monitor at the Morrisville Water Filtration Plant, Morrisville, PA.

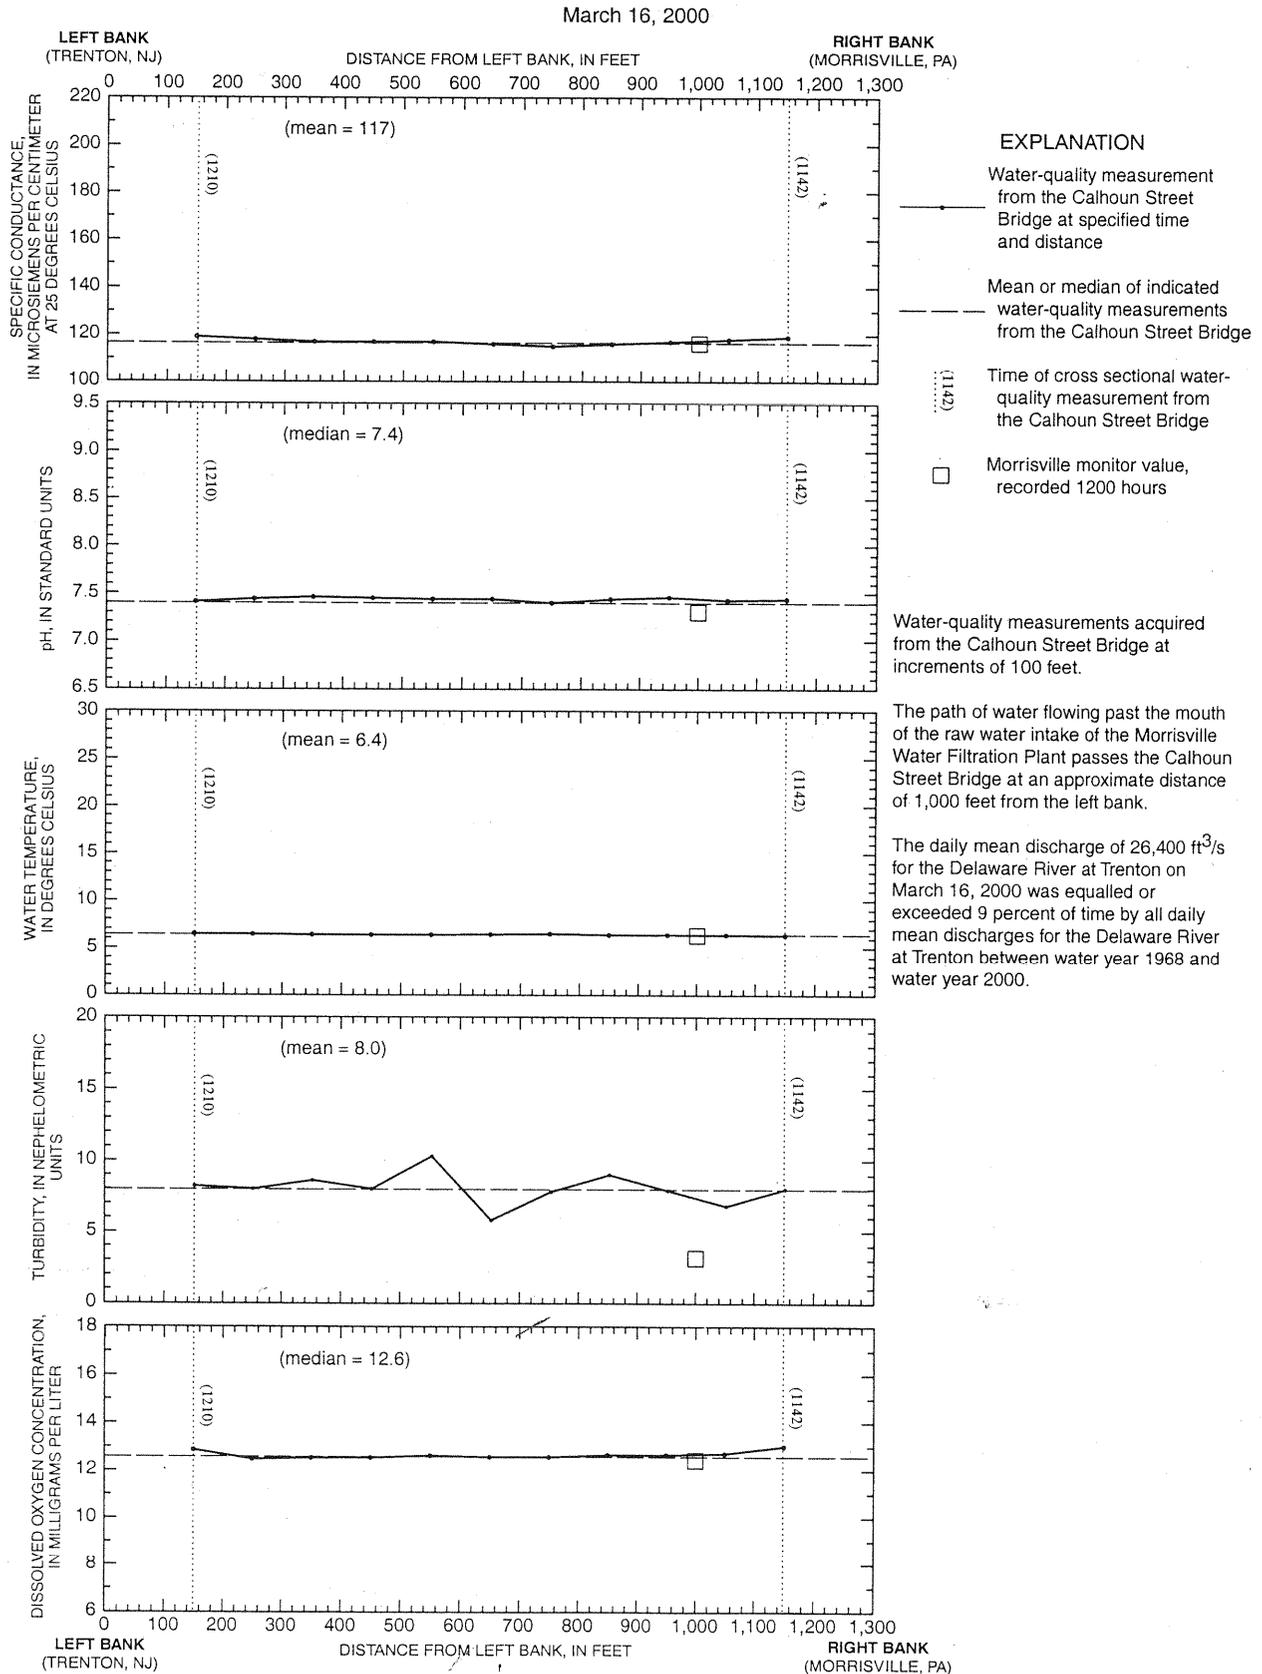

Figure 38. Cross sectional water-quality measurements with recorded monitor values, at Delaware River at Trenton, March 16, 2000.

Cross section of specific conductance, pH, water temperature, turbidity, and dissolved oxygen concentration measurements from the Calhoun Street Bridge (distance from left bank looking downstream); and recorded hourly specific conductance, pH, water temperature, turbidity, and dissolved oxygen concentration measurements from the water-quality monitor at the Morrisville Water Filtration Plant, Morrisville, PA.

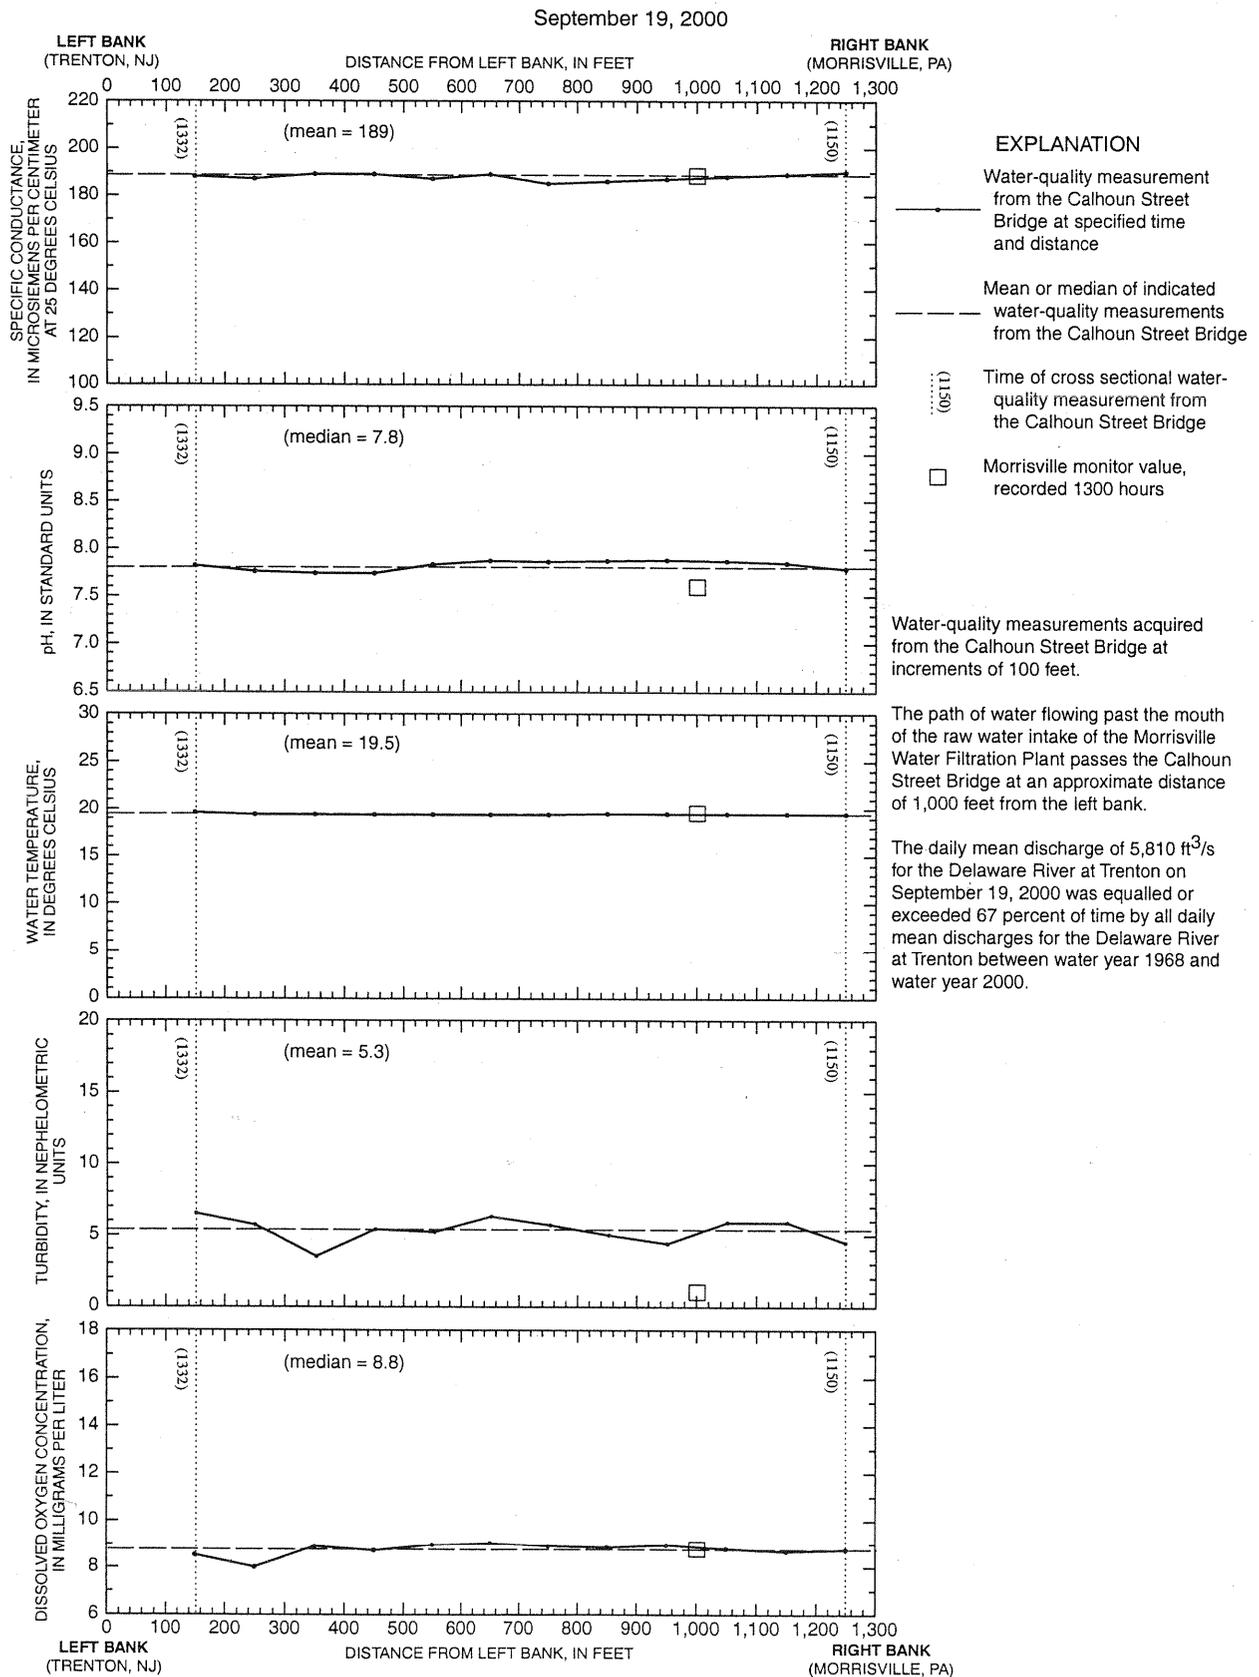

Figure 39. Cross sectional water-quality measurements with recorded monitor values, at Delaware River at Trenton, September 19, 2000.

01463850 MIRY RUN AT ROUTE 533, AT MERCERVILLE, NJ

LOCATION.--Lat 40°14'50", long 74°41'14", Mercer County, Hydrologic Unit 02040105, at bridge on State Route 533 (Quaker Bridge Road), 0.7 mi north of Mercerville, 2.1 mi upstream of Assunpink Creek, and 3.8 mi northwest of Robbinsville.

DRAINAGE AREA.--10.7 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 11.

DELAWARE RIVER BASIN

01464504 CROSSWICKS CREEK AT GROVEVILLE ROAD AT GROVEVILLE, NJ

LOCATION.--Lat 40°10'02", long 74°40'40", Mercer County, Hydrologic Unit 02040201, at bridge on Groveville Road (Main Street) in Groveville, 1.2 mi upstream of Doctors Creek, and 2.2 mi northeast of Bordentown.

DRAINAGE AREA.--98.0 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--Site is at head of tide, infrequently affected, but sampled at low tide. For definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator and Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 20.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DELAWARE RIVER BASIN

01464515 DOCTORS CREEK AT ALLENTOWN, NJ

LOCATION.--Lat 40°10'37", long 74°35'57", Monmouth County, Hydrologic Unit 02040201, at bridge on Breza Road in Allentown, and 0.8 mi downstream from Conines Millpond dam.

DRAINAGE AREA.--17.4 mi².

PERIOD OF RECORD.--Water years 1976 to current year.

REMARKS.--Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 20.

DELAWARE RIVER BASIN

01464583 NORTH BRANCH BARKERS BROOK NEAR JOBSTOWN, NJ

LOCATION.--Lat 40°01'58", long 74°40'12", Burlington County, Hydrologic Unit 02040201, at bridge on Juliustown-Georgetown Road (State Route 663), 1.3 mi east of Jobstown, 1.3 mi north of Juliustown, and 1.9 mi upstream of Barkers Brook.

DRAINAGE AREA.--1.72 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Agricultural Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 20.

01464907 LITTLE NESHAMINY CREEK AT VALLEY ROAD NEAR NESHAMINY, PA

LOCATION.--Lat 40°13'45", long 75°07'12", Bucks County, Hydrologic Unit 02040201, on left bank just upstream from bridge on Valley Road, 1.1 mi east of Neshaminy, PA, 2.0 mi downstream from Park Creek, 3.0 mi downstream from Bradford Dam, and 6.8 mi upstream from confluence with Neshaminy Creek.

DRAINAGE AREA.--26.8 mi².

PERIOD OF RECORD.--November 1998 to current year.

INSTRUMENTATION.--Water-temperature data logger (in-situ system; measurements recorded every 15 minutes) located at gage.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. Streambed sediment samples were collected during low-flow conditions to determine concentrations of trace metals and hydrophobic organic compounds. The bed sediment sample is a composite of the top 1-2 centimeters of material from at least 5 depositional areas within the stream reach. More information regarding methods can be found in Shelton and Capel, 1994, Guidelines for collecting and processing samples of stream bed sediments for analysis of trace elements and organic contaminants for the National Water-Quality Assessment Program: U.S. Geological Survey Open-File Report 94-458, 20 p. Bed sediment and fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites. These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program.

PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: February 1999 to June 1999.

EXTREMES FOR PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: maximum, 29.0 °C, Jun. 2, 1999, but may have been higher during period of missing record; minimum, -0.5 °C, Mar. 8, 1999.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

DELAWARE RIVER BASIN

01465893 LITTLE CREEK AT CHAIRVILLE, NJ

LOCATION.--Lat 39°53'53", long 74°47'19", Burlington County, Hydrologic Unit 02040202, at bridge on State Route 70 in Chairville, 250 feet east of Skeet Road, 1.9 mi east of Medford, 4.6 mi south of Lumberton, and 4.7 mi upstream of South Branch Rancocas Creek.

DRAINAGE AREA.--6.32 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Undeveloped Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 19.

01466500 MCDONALDS BRANCH IN LEBANON STATE FOREST, NJ

LOCATION.--Lat 39°53'05", long 74°30'20", Burlington County, Hydrologic Unit 02040202, on right bank in Lebanon State Forest, 25 ft upstream from Butterworth Road Bridge, 3.4 mi upstream from confluence with Cooper Branch, and 7.0 mi southeast of Browns Mills.

DRAINAGE AREA.--2.35 mi².

PERIOD OF RECORD.--Water years 1963-96, 1998 to current year.

PERIOD OF DAILY RECORD.--

SPECIFIC CONDUCTANCE: October 1968 to September 1992.

pH: October 1984 to September 1992.

WATER TEMPERATURE: October 1960 to September 1992.

DISSOLVED OXYGEN: October 1984 to September 1992.

REMARKS.--Chemical analyses are from samples collected as water flows over the weir at the gaging station. All discharge record represents flow at a point 785 ft downstream of the gaging station. Discharges at the weir may be about 1 ft³/s less than published in Water-Data Report NJ-00-1. Statistical summaries of physical properties, measured twice per hour over 2, 3, 4, or 5 days, at this and other stations, as part of the 2000 water-year watershed-reconnaissance study, are presented in "Summary of Hydrologic Conditions" in the Introduction.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Background and Watershed Reconnaissance, New Jersey Department of Environmental Protection Watershed Management Area 19.

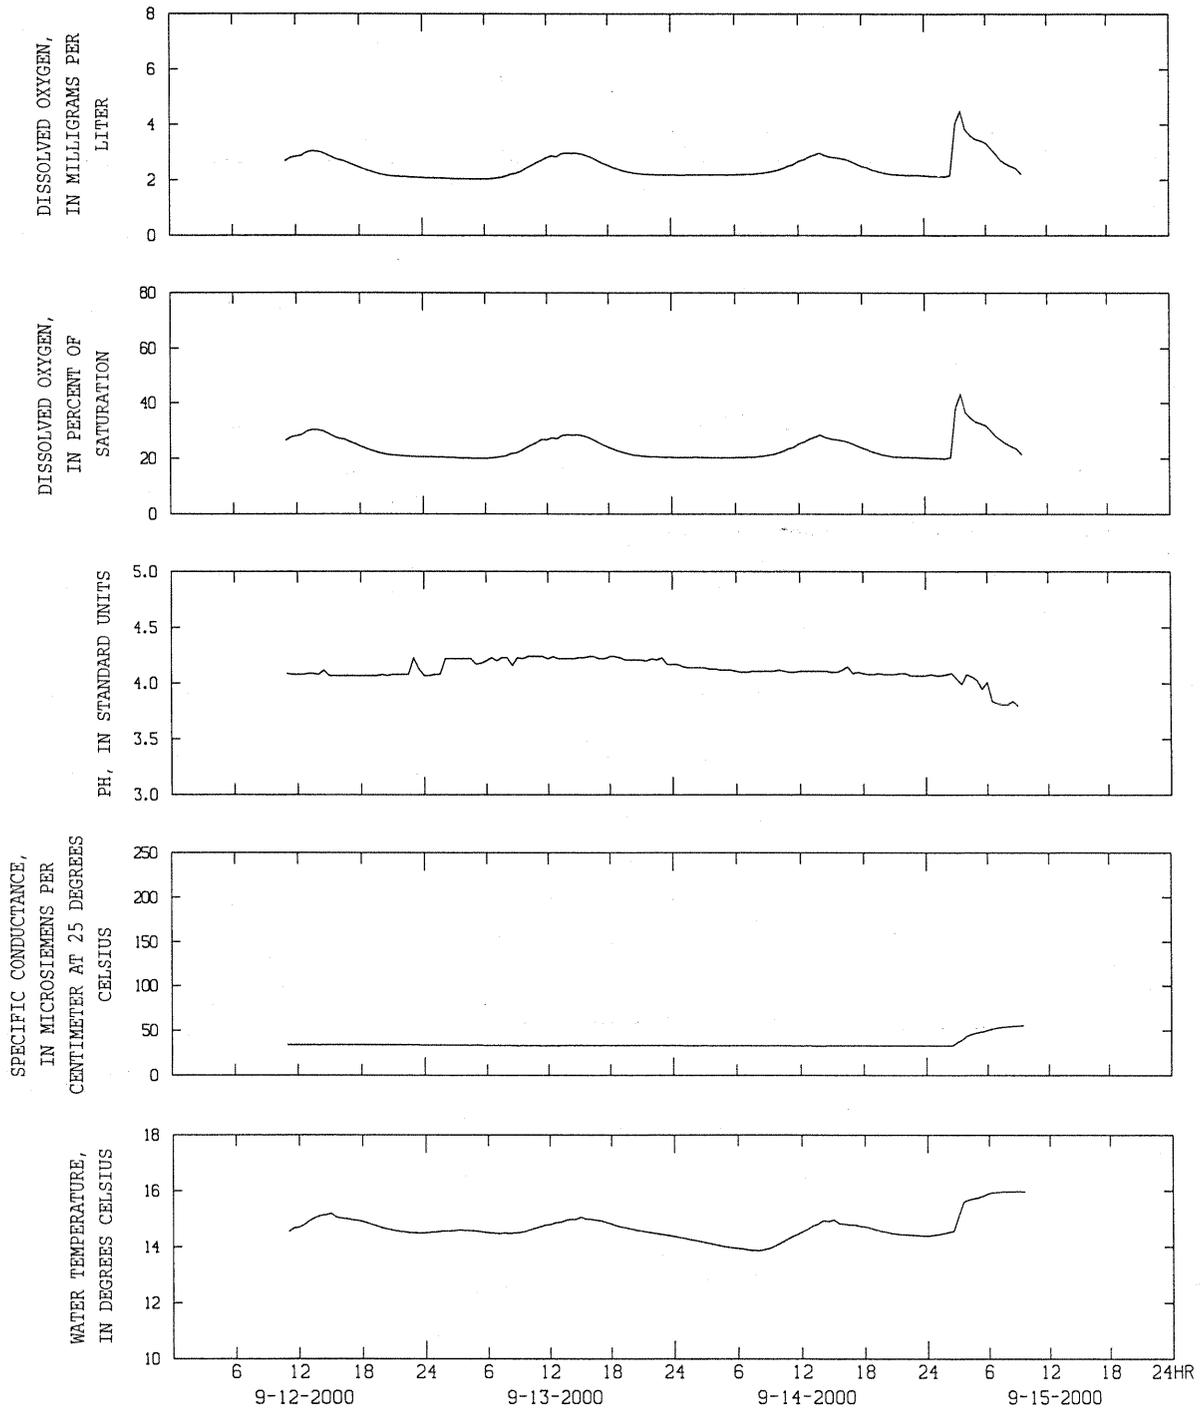

Figure 41. Reconnaissance Study -- Field characteristics and concentrations of constituents in surface water monitored at 01466500 McDonalds Branch in Lebanon State Forest.

01467005 NORTH BRANCH RANCOCAS CREEK AT IRON WORKS PARK AT MOUNT HOLLY, NJ

LOCATION.--Lat 39°59'31", long 74°46'58", Burlington County, Hydrologic Unit 02040202, at Iron Works Park footbridge, 0.3 mi north of Saint Andrews Cemetery in Mount Holly, and 0.1 mi downstream from Mill Dam.

DRAINAGE AREA.--140 mi².

PERIOD OF RECORD.--Water years 1998 to current year. Published as "at Pine Street" (station 01467006) 1998-99.

REMARKS.--Site is at head of tide; all samples collected at low tide.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, and BOD, were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 19.

DELAWARE RIVER BASIN

01467150 COOPER RIVER AT HADDONFIELD, NJ

LOCATION.--Lat 39°54'11", long 75°01'18", Camden County, Hydrologic Unit 02040202, on right bank of Wallworth Lake in Pennypacker Park, 200 ft upstream from bridge on State Highway 41 (Kings Highway) in Haddonfield, 0.6 mi upstream from North Branch Cooper River, and 7.7 mi upstream from mouth.

DRAINAGE AREA.--17.0 mi².

PERIOD OF RECORD.--Water years 1968-79, 1991 to current year.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. Fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites.

PERIOD OF DAILY RECORD.--

SUSPENDED-SEDIMENT DISCHARGE: March 1968 to September 1969.

WATER TEMPERATURE: March 1968 to August 1969; October 1998 to current year.

INSTRUMENTATION.--

WATER TEMPERATURE: Water-temperature data logger (in-situ system; measurements recorded every 15 or 30 minutes) located at gage.

COOPERATION.--Field measurements and samples for laboratory analysis on Nov. 8, Feb. 17, June 1, and Aug. 31 were provided by the New Jersey Department of Environmental Protection. Determinations of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. Coli, and enterococci bacteria on those dates were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Other field data and samples for laboratory analysis were provided by the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 19.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES
 Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

DELAWARE RIVER BASIN

01467359 NORTH BRANCH BIG TIMBER CREEK AT GLENDORA, NJ

LOCATION.--Lat 39°50'04", long 75°04'02", Camden County, Hydrologic Unit 02040206, at bridge on Chews Landing-Clementon Road (State Route 683), 0.7 mi south of Glendora, 1.8 mi upstream of South Branch Big Timber Creek, and 2.5 mi north of Blackwood.

DRAINAGE AREA.--18.8 mi².

PERIOD OF RECORD.--Water years 1998 to current year.

REMARKS.--Site is tide-affected; all samples collected at low tide.

COOPERATION.--Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E.coli, and enterococci were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Urban Land Use Indicator, New Jersey Department of Environmental Protection Watershed Management Area 18.

01470779 TULPEHOCKEN CREEK NEAR BERNVILLE, PA

LOCATION.--Lat 40°24'48", long 76°10'19", Berks County, PA, Hydrologic Unit 02040203, on left bank 30 ft downstream from bridge at Kricks Mill, 0.4 mi upstream from Mill Creek, and 3.5 mi west of Bernville.

DRAINAGE AREA.--66.5 mi².

PERIOD OF RECORD.--November 1974 to current year.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA). Fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 and LCAA (listed in their entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

SCHUYLKILL RIVER BASIN

01470962 TULPEHOCKEN CREEK WATER PLANT INTAKE AT BLUE MARSH, PA

LOCATION.--Lat 40°22'08", long 76°01'24", Berks County, PA, Hydrologic Unit 02040203, on right bank of Tulpehocken Creek at water plant intake on Water Road, 0.8 miles downstream of dam at Blue Marsh Reservoir, 1.3 miles upstream of Bridge on Rebers Bridge Road, and 7 miles northwest of Reading.

DRAINAGE AREA.--178 mi².

PERIOD OF RECORD.--May 1999 to October 2000. Prior to water year 2000 (NJ-99-3), this site was published as 01470962 Blue Marsh Reservoir Intake.

REMARKS.--These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 and LCAA (listed in their entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

SCHUYLKILL RIVER BASIN

437

01472157 FRENCH CREEK NEAR PHOENIXVILLE, PA

LOCATION.--Lat 40°09'05", Long 75°36'06", Chester County, PA, Hydrologic Unit 02040203, on right bank 70 ft downstream from two-span county bridge on French Creek Road, 4.5 mi northwest of Phoenixville, and 7.3 mi upstream from mouth.

DRAINAGE AREA.--59.1 mi².

PERIOD OF RECORD.--October 1968 to current year.

PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: November 1998 to April 1999, June 1999 to August 1999, June 2000 to September 2000.

INSTRUMENTATION.--Water-temperature data logger (in situ system; measurements recorded every 15 minutes) located at gage.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction. Streambed sediment samples were collected during low-flow conditions to determine concentrations of trace metals and hydrophobic organic compounds. The bed sediment sample is a composite of the top 1-2 centimeters of material from at least 5 depositional areas within the stream reach. More information regarding methods can be found in Shelton and Capel, 1994, Guidelines for collecting and processing samples of stream bed sediments for analysis of trace elements and organic contaminants for the National Water-Quality Assessment Program: U.S. Geological Survey Open-File Report 94-458, 20 p. Bed sediment and fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites. These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

EXTREMES FOR PERIOD OF DAILY RECORD.--

WATER TEMPERATURE: maximum, 30.5°C, July 5, 6, 1999; minimum, -0.5°C, Dec. 25, 1998, Jan. 31, Mar. 12, 13, 1999.

SCHUYLKILL RIVER BASIN

01474500 SCHUYLKILL RIVER AT PHILADELPHIA, PA

LOCATION.--Lat 39°58'04", long 75°11'20", Philadelphia County, PA, Hydrologic Unit 02040203, on right bank 150 ft upstream from Fairmount Dam, 1,500 ft upstream from bridge on Spring Garden Street in Philadelphia, and 8.7 mi upstream from mouth.

DRAINAGE AREA.--1,893 mi².

PERIOD OF RECORD.--October 1931 to current year. Records for January 1898 to December 1912, published in WSP 35, 48, 65, 82, 97, 125, 166, 202, 214, 261, 301, and 381, have been found to be unreliable and should not be used.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. These samples were collected as part of the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

REVISED RECORDS.--WSP 756: Drainage area. WSP 1302: 1936(M). WSP 1432: 1945. See also PERIOD OF RECORD.

PERIOD OF DAILY RECORD.--

SPECIFIC CONDUCTANCE: September 1998 to April 1999, July 1999 to September 1999.

WATER TEMPERATURE: September 1998 to current year.

INSTRUMENTATION.--Water-quality monitor (in situ system; measurements recorded every 15 minutes) located inside raw-water water intake of Belmont Pumping Station, Philadelphia, PA.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 and LCAA (listed in their entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

01477120 RACCOON CREEK NEAR SWEDESBORO, NJ

LOCATION.--Lat 39°44'26", long 75°15'34", Gloucester County, Hydrologic Unit 02040202, on right bank 25 ft downstream from County Bridge Route 607 on Gibbstown-Harrisonville Road (Tomlin Station Road), 1.8 mi west of Mullica Hill, and 2.8 mi east of Swedesboro.

DRAINAGE AREA.--26.9 mi².

PERIOD OF RECORD.--Water years 1965 to current year.

REMARKS.--For the definition of the type of quality-control data listed under SAMPLE TYPE refer to Quality-Control Data in the Introduction. Fish community data for this site and other sites are presented in the section Water-Quality at Miscellaneous Sites.

PERIOD OF DAILY RECORD.--

SUSPENDED-SEDIMENT DISCHARGE: June 1966 to September 1969.

WATER TEMPERATURE: May 1966 to September 1973; October 1998 to current year.

INSTRUMENTATION.--

WATER TEMPERATURE: Water-temperature data logger (in-situ system; measurements recorded every 15 or 30 minutes) located at gage.

COOPERATION.--Field measurements and samples for laboratory analysis on Nov. 30, at 0800, Feb. 1 at 0845, May 3, and Aug. 23 were provided by the New Jersey Department of Environmental Protection. Determinations of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. Coli, and enterococci bacteria on those dates were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories. Other field data and samples for laboratory analysis were provided by the Delaware River Basin National Water-Quality Assessment Program (NAWQA).

COOPERATIVE NETWORK SITE DESCRIPTOR.--Watershed Integrator, New Jersey Department of Environmental Protection Watershed Management Area 18.

WATER-COLUMN VOLATILE ORGANIC COMPOUND ANALYSES

Selected samples were analyzed for volatile organic compounds (VOCs) on schedule 2020 (listed with minimum reporting levels in the "Explanation of Records" section in the Introduction). Only VOCs identified by the analyses in one or more samples are listed in the water-quality tables.

DELAWARE RIVER BASIN

01477440 OLDMANS CREEK AT JESSUPS MILL, NJ

LOCATION.--Lat 39°39'44", long 75°13'53", Salem County, Hydrologic Unit 02040206, at bridge on Monroeville Road at Jessups Mill, 700 ft upstream of Algonkin Lake, and 0.9 mi southeast of Lincoln.

DRAINAGE AREA.--4.15 mi².

PERIOD OF RECORD.--November 1999 to August 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 18.

01482560 TWO PENNY RUN NEAR DANCEYS CORNER, NJ

LOCATION.--Lat 39°41'22", long 75°24'31", Salem County, Hydrologic Unit 02040206, at bridge on East Quillytown Road, 0.7 mi upstream from Laytons Lake, and 1.8 mi southeast of Danceys Corner.

DRAINAGE AREA.--3.44 mi².

PERIOD OF RECORD.--December 1999 to August 2000.

COOPERATION.--Field data and samples for laboratory analyses were provided by the New Jersey Department of Environmental Protection. Determination of dissolved ammonia, total ammonia, dissolved nitrite, BOD, fecal coliform, E. coli, and enterococci bacteria were performed by the New Jersey Department of Health, Public Health and Environmental Laboratories.

COOPERATIVE NETWORK SITE DESCRIPTOR.--Statewide Status, New Jersey Department of Environmental Protection Watershed Management Area 18.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

WATER QUALITY AT MISCELLANEOUS SITES

DELAWARE RIVER BASIN NATIONAL WATER-QUALITY ASSESSMENT PROGRAM SURFACE-WATER SYNOPTIC SAMPLING,
MAY 15 THROUGH JUNE 27, AND SEPTEMBER 11 THROUGH OCTOBER 16, 2000

Miscellaneous water-quality sites are locations where non-routine water-quality data are collected during one year for use in hydrologic analyses. Data are collected either intermittently or systematically for a limited period of time. Water-quality data presented in this table were collected by the Delaware River Basin National Water-Quality Assessment Program (NAWQA) as part of two basin-wide synoptic surveys of nutrients, pesticides, major ions, and organic carbon, during periods of base flow; the first survey was May 15 through June 27, 2000, and the second was September 11 through October 16, 2000. Selected samples were analyzed for pesticides on schedule 2001 (listed with minimum reporting levels in "Explanation of Records" section); only pesticides identified by the analyses in one or more samples are listed in the water-quality tables. Bed sediment and fish community data for these sites are presented on pages 470 and 507.

WATER QUALITY AT MISCELLANEOUS SITES

DELAWARE RIVER BASIN NATIONAL WATER-QUALITY ASSESSMENT PROGRAM, CONTINUOUS WATER-TEMPERATURE DATA,
JULY 17 THROUGH SEPTEMBER 30, 2000

Continuous water-temperature data were collected at the Delaware River Basin National Water Quality Assessment synoptic sites from July 17 through September 30, 2000. These data were collected to coincide with ecological data that were being collected during that time frame at most of these sites. Each site was instrumented with an, in situ, submersible, water-temperature logger that was programmed to record every 30 minutes. Additional water-quality data for these sites can be found on pages 508 and 520.

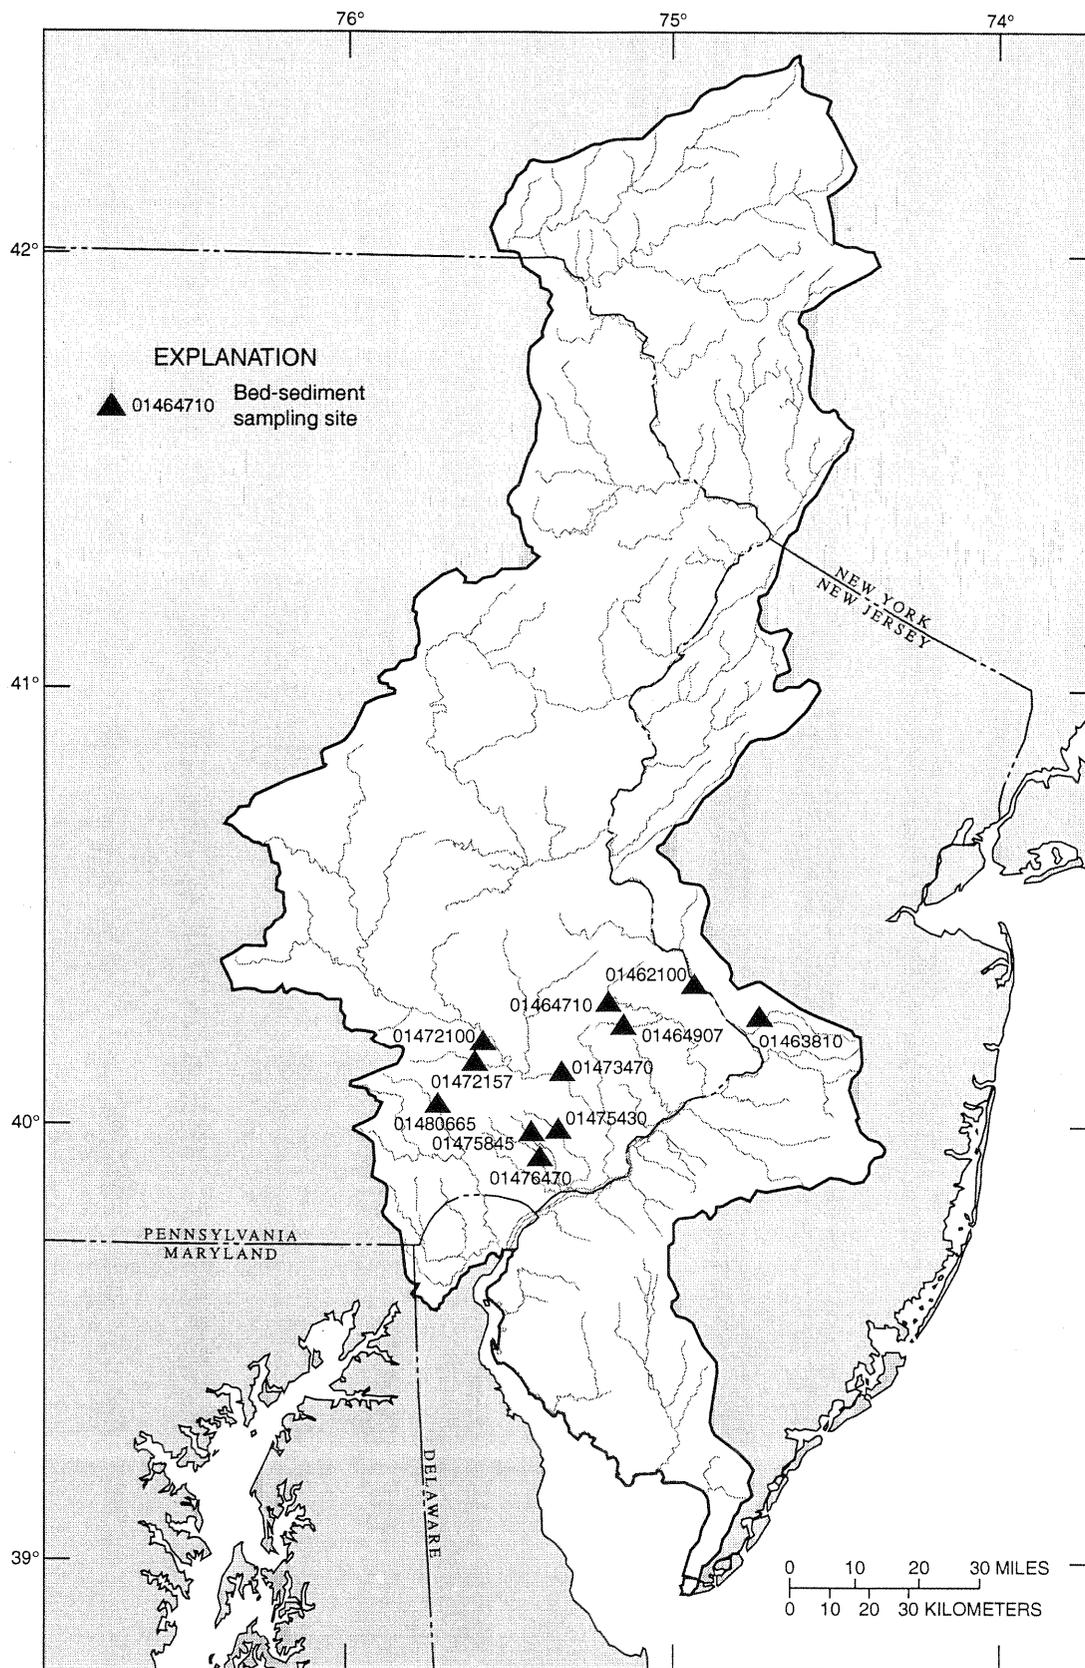

Figure 44. Location of Delaware River National Water-Quality Assessment Program bed-sediment sampling sites.

DELAWARE RIVER BASIN NATIONAL WATER-QUALITY ASSESSMENT PROGRAM, STREAMBED SEDIMENTS

SITE DESCRIPTIONS

REMARKS. -- The following table lists sites at which stream bed sediments were collected during calendar year 2000. The location of the stream gage is described if one is present at the site. Samples were collected throughout a section within several hundred meters upstream and (or) downstream of the stream gage, unless stated otherwise in the description.

Station Number	County, State	Hydrologic Unit	Site Name and description
01462100	Bucks, PA	02040105	Pidcock Creek near New Hope, PA lat 40 19'46", long 74 56'14"; samples were collected upstream of State Route 32 in the Bowman Hill Wildflower Preserve.
01463810	Mercer, NJ	02040105	Shabakunk Creek near Lawrenceville, NJ lat 40 15'19", long 74 44'17"; samples were collected upstream of Princeton Pike.
01464710	Bucks, PA	02040201	Pine Run at Chalfont, PA lat 40 17'20", long 75 12'11"; sample were collected vicinity of New Britain Township park at end of Forest Drive, off of Park Avenue.
01464907	Bucks, PA	02040201	Little Neshaminy Creek at Valley Road nr Neshaminy, PA lat 40 13' 45", long 70 07'12", stream gage on left bank at bridge on Valley Road, 1.0 mi east of Neshaminy, and 6.7 mi upstream from mouth; samples were collected upstream of Valley Road.
01472100	Chester, PA	02040203	Pigeon Creek at Parker Ford, PA lat 40 11'48", long 75 35'13"; samples were collected upstream of Bethel Church Road.
01472157	Chester, PA	02040203	French Creek near Phoenixville, PA lat 40 09'05", long 75 36'06", stream gage on right bank 70 ft downstream from two-span county bridge on French Creek Road, 4.5 mi northwest of Phoenixville, and 7.3 mi upstream from mouth; samples were collected upstream of French Creek Road.
01473470	Montgomery, PA	02040203	Stony Creek at Sterigere Street at Norristown, PA lat 40 07'38", long 75 20'43"; samples were collected upstream of Sterigere Street.
01475430	Delaware, PA	02040202	Darby Creek at Foxcroft, PA lat 39 59'45", long 75 21'21"; samples were collected upstream of State Route 320.
01475845	Chester, PA	02040202	Crum Creek at Goshen Road near Whitehorse, PA lat 39 59'24", long 75 26'16"; samples were collected vicinity of Goshen Road.
01476470	Delaware, PA	02040202	Ridley Creek near Media, PA. lat 39 55'57", long 75 24'42"; samples were collected vicinity of unnamed road upstream of West Rose Tree Road, and off of Ridley Creek Road.
01480665	Chester, PA	02040205	East Branch Brandywine Creek near Dorlan, PA lat 40 03'08", long 75 43'28"; samples were collected downstream of Reeds Road.

WATER QUALITY AT MISCELLANEOUS SITES

DELAWARE RIVER BASIN NATIONAL WATER-QUALITY ASSESSMENT PROGRAM, STREAMBED SEDIMENTS

REMARKS.--Stream bed sediment samples were collected during low-flow conditions in the Delaware River Basin during June and July 2000 to determine concentrations of trace elements and hydrophobic organic compounds in stream bed sediments. Sites were located throughout the Delaware River Basin in New Jersey and Pennsylvania. Bed sediment samples at each site were composites of the top 1 to 2 centimeters of material from at least 5 different depositional areas within the stream reach. A subsample from the composite sample collected at each site was processed for particle-size analysis. Additionally, subsamples from the composite were: (1) processed using a 2.0- millimeter stainless-steel mesh sieve for preparation of material for organic contaminant analysis, and (2) processed using a 63-micrometer nylon-cloth sieve for preparation of material for trace element analysis. Specific details describing the guidelines used in collecting and in processing the stream bed sediment samples can be found in Shelton and Capel, 1994, Guidelines for collecting and processing samples of stream bed sediment for analysis of trace elements and organic contaminants for the National Water-Quality Assessment program: U.S. Geological Survey Open-File Report 94-458, 20 p.

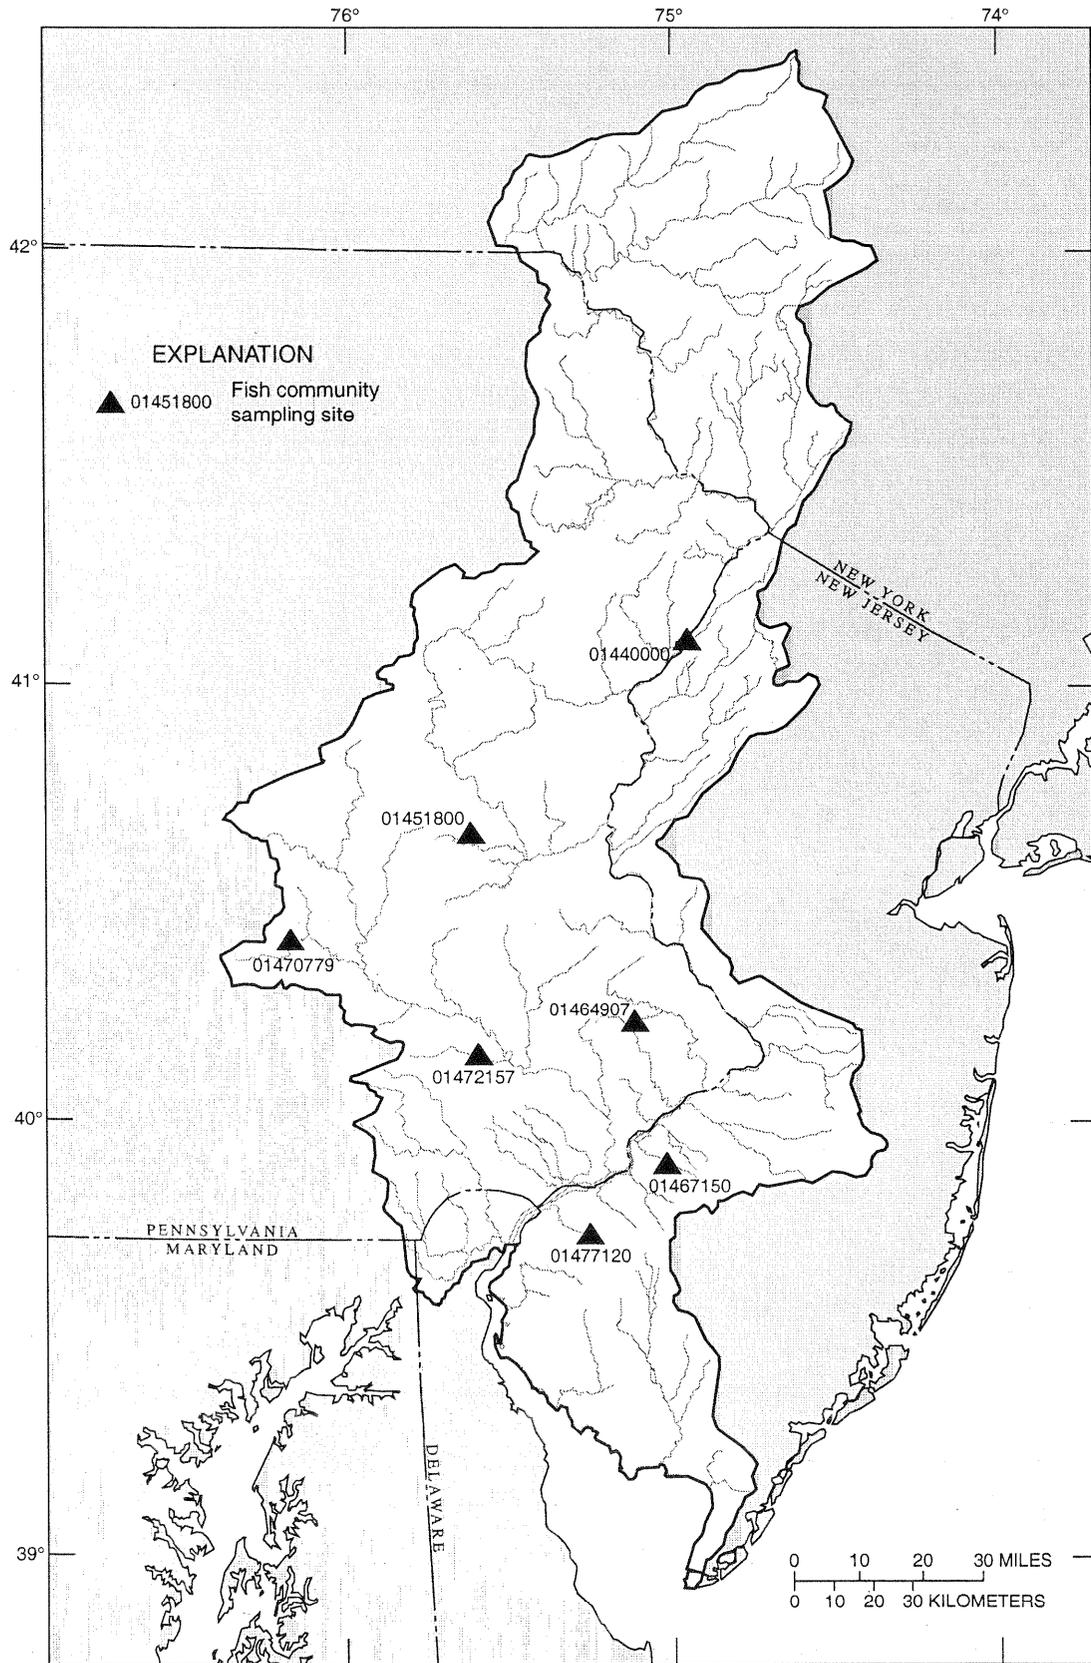

Figure 45. Location of Delaware River National Water-Quality Assessment Program fish-community sampling sites.

WATER QUALITY AT MISCELLANEOUS SITES
DELAWARE RIVER BASIN NATIONAL WATER-QUALITY ASSESSMENT PROGRAM, FISH COMMUNITY SURVEY

Fish-community surveys were conducted at 7 stream sites in the Delaware River basin during 2000. Sites were located in New Jersey and Pennsylvania. Fish were collected by electrofishing with pulsed-DC current in a representative 153 to 310 meter long reach at each stream site. One electrofishing pass was conducted at each reach. One-quarter inch mesh was used for the dip nets. Fish were identified, measured, weighed, and checked for anomalies such as parasites, lesions, and skeletal deformities. Most individuals were returned to the stream after processing. More details regarding collection methods can be found in Meador and others, 1993, Methods for sampling fish communities as part of the National Water-Quality Assessment program: U.S. Geological Survey Open-File Report 93-104, 40 p. Additional surface-water and/or water-quality data for these sites can be found in the continuous record station section of this report. Family names are in uppercase, scientific names are in italics, and common names follow. Minimum and maximum total lengths (in mm) are in parenthesis below abundance.

List of stations and collection dates

Station ID	Station name	Collection Date

WATER QUALITY AT MISCELLANEOUS SITES

LANDSCAPE INDICATORS FOR PESTICIDES STUDY - MID-ATLANTIC COASTAL STREAMS

REMARKS.--The following data was collected in New Jersey as part of the Landscape Indicators for Pesticides Study - Mid-Atlantic Coastal Streams. The accompanying map locates the 11 sites within New Jersey. The larger study area included the coastal plains of North Carolina, Virginia, Maryland, and Delaware. For the definition of the type of quality-control data listed under SAMPLE TYPE, refer to Quality-Control Data in the Introduction.

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

STATION NUMBER	STATION NAME	DATE	TIME	SAMPLE TYPE
01405150	MILFORD BROOK AT HERBERTSVILLE, NJ	05-04-00 05-04-00	1410 1500	FIELD BLANK ENVIRONMENTAL

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

STATION NUMBER	DATE	TIME	ALA-CHLOR, WATER, DISS, REC (UG/L) (46342)	ATRA-ZINE, WATER, DISS, REC (UG/L) (39632)	CAR-BARYL WATER FLTRD 0.7 U GF, REC (UG/L) (82680)	DCPA WATER FLTRD 0.7 U GF, REC (UG/L) (82682)	DEETHYL ATRA-ZINE, WATER, DISS, REC (UG/L) (04040)	DI-AZINON, DIS-SOLVED (UG/L) (39572)	DI-ELDRIN, DIS-SOLVED (UG/L) (39381)	EPTC WATER FLTRD 0.7 U GF, REC (UG/L) (82668)

WATER-QUALITY DATA, WATER YEAR OCTOBER 1999 TO SEPTEMBER 2000

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

STATION NUMBER	DATE	TIME	ALA-CHLOR,	ATRA-ZINE,	CAR-BARYL,	DCPA	DEETHYL	DI-	DI-	EPTC

WATER-COLUMN PESTICIDE ANALYSES

Selected samples were analyzed for pesticides using laboratory schedule 2001 (listed in its entirety, with minimum reporting levels, in the "Explanation of the Records" section in the Introduction). Only pesticides identified by the analyses in one or more samples are listed in the following table.

STATION NUMBER	DATE	TIME	ALA-CHLOR, WATER, DISS, REC	ATRA-ZINE, WATER, DISS, REC	CAR-BARYL, WATER, FLTRD, GF, REC	DCPA, WATER, FLTRD, GF, REC	DEETHYL ATRA-ZINE, WATER, DISS, REC	DI-AZINON, DIS-SOLVED	DI-ELDRIN, DIS-SOLVED	EPTC, WATER, FLTRD, GF, REC

**GROUND-WATER DATA COLLECTED AT SPECIAL-STUDY SITES
DELAWARE RIVER BASIN NAWQA PROJECT**

**GROUND WATER IN THE CLASTIC BEDROCK WITHIN THE TRIASSIC LOWLANDS SECTION OF THE PIEDMONT
PHYSIOGRAPHIC PROVINCE**

The following tables contain site, water-level, and water-quality data from a network of 30 domestic and observation wells. The network was established as part of the National Water-Quality Assessment (NAWQA) Program in the Delaware River Basin (DELR).

The wells were sampled to assess the status of ground-water quality in the clastic bedrock of the Piedmont Physiographic Province. Samples were tested for field parameters, nutrients, major ions, trace elements, dissolved and volatile organic compounds (VOCs), pesticides (including their metabolites), and radioisotopes. Many VOCs and pesticide constituents were not detected at any of the 30 wells.

Tables listing all of the VOC and pesticide schedule analytes and their reporting levels are on pages 463-466. Only VOCs and pesticide compounds measured at or above the reporting levels at one or more sites (either surface water or ground water) of the DELR NAWQA Project are listed in the water-quality table.

WATER-QUALITY CONTROL DATA

As part of the water-quality sampling for the DELR NAWQA, an extensive quality-assurance plan was executed to ensure the integrity of the sample results. Quality-control samples were collected as blanks, including ambient, trip, source-solution, and equipment blanks; replicates; and spikes. These quality-control samples were analyzed for nutrients, major ions, trace elements, dissolved and volatile organic compounds, pesticides and their metabolites, and radioisotopes. Source-solution blanks were analyzed for volatile organic compounds (VOCs) and dissolved organic carbon (DOC), and spikes were analyzed for pesticides and VOCs.

The following summarizes the quality-control sample results: Replicate samples were collected at 20 separate sample sites for one or more of the above chemical groups. All replicates closely reproduced the results for the environmental samples. Results from replicate samples are included within the water-quality tables on pages 601-622. Twenty-eight blank samples were collected. Concentrations of all constituents analyzed in the blank samples were less than the method detection limits, except for total toluene, which had two detections at E 0.01 and E 0.04 µG/L. As a result, toluene was censored for results below the lab reporting limit of 0.05 µG/L, and was assigned a value of <0.05 µG/L. The four pesticide spikes of 100-µL/1-L liter of sample had recoveries between 72 and 113 percent. The four VOC spikes of 20-µL/40-mL of sample had recoveries between 96 and 104 percent.

**GROUND-WATER DATA COLLECTED AT SPECIAL-STUDY SITES
DELAWARE RIVER BASIN NAWQA PROJECT**

GROUND WATER IN THE CLASTIC BEDROCK WITHIN THE VALLEY AND RIDGE PHYSIOGRAPHIC PROVINCE

The following tables contain site, water-level, and water-quality data from a network of 30 domestic and observation wells. The network was established as part of the National Water-Quality Assessment (NAWQA) Program in the Delaware River Basin (DELR).

The wells were sampled to assess the status of ground-water quality in the clastic bedrock of the Valley and Ridge Physiographic Province. Samples were tested for field parameters, nutrients, major ions, trace elements, dissolved and volatile organic compounds (VOCs), pesticides (including their metabolites), radioisotopes, and selected bacteriological parameters. Many VOCs and pesticide constituents were not detected at any of the 30 wells.

Tables listing all of the VOC and pesticide schedule analytes and their reporting levels are on pages 463-466. Only VOCs and pesticide compounds measured at or above the reporting levels at one or more sites (either surface water or ground water) of the DELR NAWQA Project are listed in the water-quality table.

WATER-QUALITY CONTROL DATA

As part of the water-quality sampling for the DELR NAWQA, an extensive quality-assurance plan was executed to ensure the integrity of the sample results. Quality-control samples were collected as blanks, including ambient, trip, source solution, and equipment; replicates; and spikes. These quality-control samples were analyzed for nutrients, major ions, trace elements, dissolved and volatile organic compounds, pesticides and their metabolites, radioisotopes, and bacteria. Source-solution blanks were analyzed for volatile organic compounds (VOCs), and spikes were analyzed for pesticides and VOCs.

The following summarizes the quality-control sample results: Replicate samples were collected at 15 separate sample sites for one or more of the above chemical groups. All replicate closely reproduced the results for the environmental samples. Results from replicate samples are included within the water-quality tables on pages 625-646. Thirty-one blank samples were collected. Concentrations of all constituents analyzed in the blank samples were less than the method detection limits, except for total toluene, which had three detections at E 0.01, E 0.01, and E 0.02 µG/L. As a result, toluene was censored for results below the lab reporting limit of 0.05 µG/L, and was assigned a value of <0.05 µG/L. The two pesticide spikes of 100-µL/1-L liter of sample had recoveries between 96 and 114 percent. The two VOC spikes of 20-µL/40-mL had recoveries between 91 and 109 percent. For the bacteriological samples, 69 quality-control samples were run (30 equipment blanks, 30 final blanks run between each test series, and 9 replicates). Two of the final blanks had a total coliform count of 1 colony/100 mls, indicating incomplete rinsing between dilutions. Both of the series with the final blank detections had high coliform counts. The differences between the sets of 9 replicates were within five percent.

Base from U.S. Geological Survey digital line graph files, 1:24,000

CONVERSION FACTORS AND VERTICAL DATUM

Multiply	By	To obtain
<i>Length</i>		
inch (in.)	2.54×10^1	millimeter
	2.54×10^{-2}	meter
foot (ft)	3.048×10^{-1}	meter
mile (mi)	1.609×10^0	kilometer
<i>Area</i>		
acre	4.047×10^3	square meter
	4.047×10^{-1}	square hectometer
	4.047×10^{-3}	square kilometer
square mile (mi ²)	2.590×10^0	square kilometer
<i>Volume</i>		
gallon (gal)	3.785×10^0	liter
	3.785×10^0	cubic decimeter
	3.785×10^{-3}	cubic meter
million gallons (Mgal)	3.785×10^3	cubic meter
	3.785×10^{-3}	cubic hectometer
cubic foot (ft ³)	2.832×10^1	cubic decimeter
	2.832×10^{-2}	cubic meter
cubic-foot-per-second day [(ft ³ /s) d]	2.447×10^3	cubic meter
	2.447×10^{-3}	cubic hectometer
acre-foot (acre-ft)	1.233×10^3	cubic meter
	1.233×10^{-3}	cubic hectometer
	1.233×10^{-6}	cubic kilometer
<i>Flow</i>		
cubic foot per second (ft ³ /s)	2.832×10^1	liter per second
	2.832×10^1	cubic decimeter per second
	2.832×10^{-2}	cubic meter per second
gallon per minute (gal/min)	6.309×10^{-2}	liter per second
	6.309×10^{-2}	cubic decimeter per second
	6.309×10^{-5}	cubic meter per second
million gallons per day (Mgal/d)	4.381×10^1	cubic decimeter per second
	4.381×10^{-2}	cubic meter per second
<i>Mass</i>		
ton (short)	9.072×10^{-1}	megagram or metric ton

Sea level: In this report "sea level" refers to the National Geodetic Vertical Datum of 1929 (NGVD of 1929)—a geodetic datum derived from a general adjustment for the first-order level nets of both the United States and Canada, formerly called Sea Level Datum of 1929.

U.S. DEPARTMENT OF THE INTERIOR
U.S. Geological Survey
810 Bear Tavern Road, Suite 206
West Trenton NJ 08628-1099
