CHEMICAL ANALYSES OF SURFACE WATER IN ILLINOIS, 1975-77

VOLUME II

Illinois River basin and Mississippi River tributaries north of Illinois River basin

By David Grason and R. W. Healy

ABSTRACT

Samples of surface water were collected and analyzed by the Illinois Environmental Protection Agency. The results from water years 1975 to 1977 are presented in tabular form, and the history of sampling and analytical methods during that period are summarized. Stream discharge data from records of the U.S. Geological Survey are included for all sites where samples were collected at gaging stations or near enough that reliable discharge estimates could be made.

INTRODUCTION

The Illinois Environmental Protection Agency (IEPA) and its predecessor in data collection, the Stream Pollution Control Bureau of the Illinois Department of Public Health, have collected chemical and physical quality data on Illinois streams since 1958. The purpose of this program is to determine the nature and extent of water pollution in the State and to provide the water-quality data necessary to carry out the IEPA's mission of reducing pollution of Illinois waters.

In 1977 IEPA collected samples at 590 sites. The most common frequency of sample collection was monthly. Each year IEPA published a summary of data, which included the number of analyses for each parameter, maximum value, minimum value, mean value, median value, and the criterion or standard to which the published values could be compared. While that summary served the needs of many data users and fulfilled IEPA's objective of determining the nature and extent of water pollution, many data users would benefit much more from the actual analyses than from the summary. The chemical and physical data collected by IEPA during the 1975-77 water years are presented in three volumes. The main purpose of these reports and their predecessors (Healy and Toler, 1978 a, b, and c) is to make all the data available to users.

The U.S. Geological Survey (USGS) maintains a network of stream-gaging stations in Illinois in cooperation with State, local, and other Federal agencies. Many of the stations sampled by IEPA and included in this report are at or near these gaging stations. Where possible, discharge values from USGS records have been added.

If the sampling station was at or near a USGS gaging station, the heading information in table 5 includes the USGS gaging station number, name, drainage area for the gaging station, and the ratio used to compute the discharge at the sampling station. The ratio is determined by the relative size of the drainage areas.

The discharge values included in this report are the mean values for the day the samples were collected. This value may be considerably different from the discharge at the precise time the sample was collected, especially on smaller streams subject to rapid changes in flow conditions.

The data presented in table 5 were visually scanned for gross errors. Although some questionable analyses were deleted, no large blocks of data were eliminated.

ACKNOWLEDGMENT

We are grateful to Mr. John W. Brother, Jr., Illinois State Water Survey, Urbana, Illinois, for preparation of the cover, title pages, and figure 1.

DEFINITION OF TERMS

Terms related to streamflow and water quality as used in the report are given below:

Acidity is a measure of the concentration of solutes (electrolytes) capable of reacting with hydroxyl ion, as in a neutralization titration. Organic material, free mineral acids, and gases may contribute to acidity, which is expressed as equivalent calcium carbonate (CaCO_3) needed to titrate the sample to alkaline conditions.

Alkalinity is the capacity of a water to neutralize acids. Alkalinity in water is caused primarily by bicarbonates, carbonates, and hydroxides, and is expressed as equivalent calcium carbonate (CaCO_3).

Biochemical oxygen demand (BOD) is the amount of oxygen required by bacteria while stabilizing decomposable organic matter under aerobic conditions.

Carbon-chloroform extract (CCE) is a mixture of organic compounds that can be adsorbed on activated carbon under prescribed conditions and then desorbed with the solvent chloroform. This is one measure of the sum total of a water's organic contaminants, such as insecticides and herbicides.

Chemical oxygen demand (COD) indicates the quantity of oxidizable compounds in water and varies with water composition, temperature, period of contact, and other factors.

Color is a measure of a water's tinge. The color unit is produced by one milligram per liter of platinum in the form of the chloroplatinate ion. Color is expressed in units of the platinum-cobalt scale.

Cubic foot per second (CFS) is the rate of discharge representing a volume of 1 cubic foot passing a given point during 1 second and is equivalent to 7.48 gallons per second or 448.8 gallons per minute.

Discharge is the volume of water (or more broadly, total fluids) that passes a given point within a given period of time. The mean discharge for the day the sample was taken is reported as "DISCHARGE" in this report.

Dissolved solids—See residue on evaporation.

Fecal coliform bacteria are bacteria that are present in the intestines or feces of warm-blooded animals. They are often used as indicators of the sanitary quality of the water. In the laboratory they are defined as all organisms that produce blue colonies within 24 hours when incubated at $44.5^{\circ}\text{C} \pm 0.2^{\circ}\text{C}$ on M-FC medium (nutrient medium for bacterial growth). Their concentrations are expressed as number of colonies per 100 mL of sample.

Hardness of water is a physical-chemical characteristic that is commonly recognized by the increased quantity of soap required to produce lather. It is attributable to the presence of alkaline earths (principally calcium and magnesium) and is expressed as equivalent calcium carbonate (CaCO_3).

Kjeldahl nitrogen is the sum of free-ammonia and organic nitrogen compounds that are converted to ammonium sulfate $(\text{NH}_4)_2\text{SO}_4$ under special conditions of sample preparation. The sum of all nitrogen in a water sample is equal to Kjeldahl nitrogen plus nitrite and nitrate nitrogen concentrations.

Methylene blue active substance (MBAS) is a measure of apparent detergents, expressed in mg/L of an industry standard. The determination depends on the formation of a blue color when methylene blue dye reacts with synthetic detergent compounds.

Milligrams per liter (MG/L, mg/L) is a unit for expressing the concentration of chemical constituents in solution. Milligrams per liter represents the mass of solute per unit volume of water. Milligrams per liter may be converted to milliequivalents (one-thousandth of a gram-equivalent weight of a constituent) per liter by multiplying by the factors in table 1.

Organic nitrogen includes all nitrogenous organic compounds such as amino acids, polypeptides, and proteins. It is present naturally in all surface waters as a result of normal nitrogenous products and biological life in the watersheds and streams, but excessive concentrations may indicate pollution.

Hydroxide (OH^{-1})	.05880	Sulfate (SO_4^{-2})	.02082
Iodide (I^{-1})	.00788	Zinc (Zn^{+2})	.03060

The pH of water is a measure of the hydrogen ion concentration or more specifically, the hydrogen ion activity. It is most conveniently expressed in logarithmic units and represents the negative base-10 log of the hydrogen ion activity in moles per liter.

Phenols are a class of organic compounds found in water usually as a result of pollution from oil refineries, coke plants, and from chemical manufacture. Even low concentrations of phenol impart a very disagreeable taste and odor to drinking water.

Plankton is the community of suspended, floating, or weakly swimming organisms that live in the open water of lakes and rivers.

Residue on evaporation (ROE) is a measure of dissolved substances in a water sample. Determinations in this report were made on samples filtered through a glass fiber filter and thus may include some fine particulate matter.

Specific conductance (SPEC COND) is a measure of the ability of a water to conduct an electrical current and is expressed in micromhos per centimeter at 25°C. Because the specific conductance is related to the number and specific chemical types of ions in solution, it can be

used for approximating the dissolved-solids content in the water. Commonly, the amount of dissolved solids (in milligrams per liter) is about 65 percent of the specific conductance (in micromhos per centimeter at 25°C). This relation is not constant from stream to stream, and it may even vary in the same source with changes in the composition of the water.

Suspended solids are those substances that are retained on a glass fiber filter.

The turbidity of a water is the reduction of transparency due to the presence of suspended particulate matter. Such material may consist of clay or silt, finely divided organic matter, or other microscopic organisms which cause light to be scattered and adsorbed rather than transmitted in straight lines through the sample. The standard unit for expression of turbidity is the Jackson Turbidity Unit (JTU).

Volatile suspended solids (VSS) are those suspended solids volatilized when the glass fiber filter from the suspended solids determination is ignited in a furnace at 550°C.

METHODS

The general procedure for collecting samples from 1975 to 1977 was to take a dip sample with a bucket from the upper six to eight inches of the water column in midstream. The sampler then filled the proper bottles from the bucket. Special bottle holders were used for samples for dissolved oxygen determinations. Conditions of pooled water, backwater, or other flow conditions were generally not documented. Therefore, analyses may not represent the quality of actual stream discharge where special flow conditions occur.

Sample preservation procedures are summarized in table 2. The laboratory supplies to the field personnel special color-coded bottles that already contain the required preservatives. Samples requiring refrigeration are immediately chilled after collection.

All temperature values in this report are in degrees Celsius and may be converted to degrees Fahrenheit by using table 3.

All samples for chemical analyses were collected by personnel of the Illinois Environmental Protection Agency. All samples, except some for stations J81 and J82 which were analyzed by the USGS, were analyzed by IEPA laboratories. The agency maintains laboratories in Champaign, Chicago, and Marion. The analyzing laboratory is noted in the station heading for each station in the table of chemical analyses. Analytical methodology from 1975 to 1977, as it can be documented, is summarized in table 4.

Table 2.—Methods of sample preservation

Bottle type	Preservative	Constituent

Table 4.—Analytical methods summary for chemical analyses of water samples
in the Illinois Environmental Protection Agency laboratories
(Information for summary provided by Illinois Environmental Protection Agency)

1. Champaign Laboratory		2. Chicago Laboratory	3. Marion Laboratory
PROPERTY OR CONSTITUENT	STORET CODE	LAB	METHOD
ACIDITY, TOTAL ¹	00435	All	Titration to phenolphthalein end point (pH 8.2).
		1	Mid 1972 to February 1975; titrated hot after adding peroxide and back titrated as per American Society of Testing and Materials (ASTM) procedures. February 1975 to present; titrated at ambient temperature which for some samples causes a reduction in values. Compatability of results from different methodologies is questionable.
		2	Prior to February 1975; cold titrated without pre-treatment. For the remainder of 1975; titrated at boiling temperature. For 1976 to present; titrated at ambient temperature which for some samples causes a reduction in values. Compatability of results from different methodologies is questionable.
		3	Prior to 1976; titrated at boiling temperature. 1976 to present; cold titration following oxidation with peroxide and boiling. Significant lowering of acidity values noted. Compatability of results from different methodologies is questionable.
ALKALINITY	00410	All	Titrimetric method using standard acid and methyl purple indicator (pH of end point 4.8).
BORON	81209	All	Mid 1972 to present; colorimetric (carminic acid) on autoanalyzer.
BIOCHEMICAL OXYGEN DEMAND (BOD)	00310	All	Determination accomplished by diluting suitable portions of the sample with water saturated with oxygen and measuring the dissolved oxygen in the mixture immediately and again after a period of 5 days incubation at 20°C.
CARBON- CHLOROFORM EXTRACT	32005	1	Gravimetric adsorption-extraction procedure using Soxhlet apparatus.
		2,3	These laboratories did not perform this analysis.

¹ Total here refers to the sum of all acid contributing species.

Table 4.—Analytical methods summary for chemical analyses of water samples in the Illinois Environmental Protection Agency laboratories—Continued

PROPERTY OR CONSTITUENT	STORET CODE	LAB	METHOD
CHEMICAL OXYGEN DEMAND (COD)	00335	1,3	Dichromate reflux method.
		2	From 1973 to present; dichromate reflux method. Samples filtered if much particulate matter present.
CHLORIDE	81212	All	Colorimetric ferricyanide autoanalyzer method.
COLOR	00080	1	Colorimetric and spectrophotometric. Most are colorimetric.
		2	Visual comparison with chloroplatinate standards.
		3	This laboratory did not perform this analysis.
CYANIDE	81210	1,2	From mid 1972 to April 1975; automated pyridine-benzidine with micropredistillation. April 1975 to present; automated pyridine-barbituric acid method with micropredistillation.
		3	Same as laboratories 1 and 2 but exact month of change not available.
FECAL CORIFORM BACTERIA	31616	All	Membrane filter method.
FLUORIDE	81211	1	Mid 1972 to present; colorimetric SPADNS on auto-analyzer using a microdistillation step in the analysis.
		2	December 1973 to present; same method as laboratory 1.
		3	1968 to present; same method as laboratory 1.
HARDNESS	00900	All	EDTA titrimetric method.
METHYLENE BLUE ACTIVE SUBSTANCE	38260	All	February 1968 to June 1976; colorimetric auto-analyzer method. Discontinued in 1976 due to poor creditability of results.

Table 4.—Analytical methods summary for chemical analyses of water samples in the Illinois Environmental Protection Agency laboratories—Continued

PROPERTY OR CONSTITUENT	STORET CODE	LAB	METHOD
METALS, GENERAL		1	Mid 1972 to present; atomic adsorption method directly from acid preserved sample. No digestion prior to analysis before December 12, 1977; therefore metal concentrations probably lower than true total ³ metal concentrations.
BARIUM	01007		
CADMIUM	81214		
CHROMIUM, TOTAL ²	81217		
COPPER	81218		
IRON, TOTAL ³	81219		
IRON, DISSOLVED ³	01046	2	Same as laboratory 1, except 1973 to present; lead analyzed by boat method.
LEAD	81220		
MANGANESE	81221		
NICKEL	81222	3	Same as laboratory 1, except method initiated in late 1967. As of July 1978, metals analyses are no longer made at this laboratory.
SILVER	81223		
ZINC	81224		
METALS, SPECIFIC		All	Generation of gaseous anhydride by atomic absorption analysis (initiated in 1973 in Champaign and Marion labs; in 1972 in Chicago).
ARSENIC	01002		
SELENIUM	01147		
CHROMIUM, HEXAVALENT	81215	All	Colorimetric diphenyl carbazide method. No digestion prior to analysis before December 12, 1977; therefore metal concentrations probably lower than true total ³ metal concentrations.
CHROMIUM, TRIVALENT	81216	All	Calculated by subtracting hexavalent chromium from total ² chromium concentrations.
MERCURY	71900	1,2	From 1973; mercometer analyzers used. Presently using semiautomated-flameless atomic absorption.
		3	From 1973; mercometer analyzer used.
NITROGEN, AMMONIA	81213	All	August 1974 to present; automated phenolate method using sodium nitroprusside to give greater sensitivity.
NITROGEN, NITRATE + NITRITE	00630	All	November 1972 to present; oxidation of any nitrite to nitrate and cadmium reduction method on auto-analyzer.
NITROGEN, KJELDAHL	00625	1	Sample digested with a mixture of H ₂ SO ₄ , HgO and K ₂ SO ₄ . Resulting digestate analyzed as for ammonia nitrogen.
		2,3	These laboratories did not perform this analysis.

² Total here refers to the sum of the divalent and hexavalent species of chromium.

³ Total here refers to analysis of an unfiltered sample, whereas dissolved indicates the samples are filtered through a 0.45/um filter before analysis.

Table 4.—Analytical methods summary for chemical analyses of water samples in the Illinois Environmental Protection Agency laboratories—Continued

PROPERTY OR CONSTITUENT	STORET CODE	LAB	METHOD
NITROGEN, ORGANIC	00605	1	Calculated from total Kjeldahl nitrogen minus ammonia nitrogen.
		2,3	These laboratories did not perform this analysis.
OIL AND GREASE	00550	All	1972 to present; Freon extraction of oil: gravimetric analysis.
OXYGEN, DISSOLVED	00300	All	Azide modification of Winkler method (iodometric titration). Titration performed in laboratory.
pH	00400	All	Laboratory pH meter, using known standards for meter calibration.
PHENOL	32730	1	1972 to present; colorimetric analysis (4-amino anti-pyrene with potassium ferricyanide) on autoanalyzer with automated distillation.
		2,3	Automated method started in 1968.
PHOSPHORUS, TOTAL ⁴	00665	1	Mid 1972 to present; strong acid digestion followed by colorimetric analysis on autoanalyzer using stannous chloride reduction.
		2	Same as for laboratory 1 except started in February 1972.
		3	Same as for laboratory 1 except on March 15, 1978, changed to automated colorimetric ascorbic acid reduction method.
PLANKTON	60050	All	Concentration of sample by centrifuge, then microscopic counting using Palmer cell.
RESIDUE ON EVAPORATION	70300	All	Gravimetric analysis of sample filtered through glass fiber filter and dried at 180°C.
SPECIFIC CONDUCTANCE	00095	All	Wheatstone bridge with standardized conductivity cell. Analysis performed in laboratory.

⁴ Total here means the sum total of phosphorus present in any form, organic or inorganic. This analysis is performed on an unfiltered water sample.

Table 4.—Analytical methods summary for chemical analyses of water samples in the Illinois Environmental Protection Agency laboratories—Continued

PROPERTY OR CONSTITUENT	STORET CODE	LAB	METHOD
SULFATE	00945	All	1973 to present; methylthymol blue method of analysis on autoanalyzer.
SULFUR	80107	1	Sample digested with bromine and HNO_3 , then analyzed for SO_4^{-2} .
		2,3	These laboratories did not perform this analysis.
SUSPENDED SOLIDS	00530	All	Gravimetric analysis. Filtration is performed with glass fiber filters; sample dried at 103°C .
TURBIDITY	00070	1	1972 to present; analysis on nephelometer.
		2	1971 to present; analysis on nephelometer.
		3	For this report period; nephelometer.
VOLATILE SUSPENDED SOLIDS	00535	All	Gravimetric analysis; glass fiber filters used in TSS analysis ignited in furnace at 550°C .

PRESENTATION OF DATA

The chemical analyses are presented in three volumes based on river basin boundaries (fig. 1). Volume I includes the Des Plaines River basin and Lake Michigan. Volume II includes the Illinois River basin and the Mississippi River tributaries north of the Illinois River basin, and Volume III contains the Ohio River tributaries and all Mississippi River tributaries south of the Illinois River basin.

Within each volume the data are tabulated in alpha-numeric order using alphabetic basin codes (fig. 1) and station numbers assigned by the Illinois Environmental Protection Agency.

The station headings contain information as follows:

- Line 1. Basin code, station number, and stream name.
- Line 2. Location.
- Line 3. IEPA laboratory and USGS station number and name from which discharge data were obtained.
- Line 4. Drainage area, in square miles, at the USGS station and a factor used to convert discharge at the gaging station to discharge at the sampling station.

Most constituents are expressed in concentrations of the ion or species stated in the column headings (table 5). As examples, trivalent chromium is expressed as mg/L of Cr^{+3} ; cyanide as mg/L of CN^{-1} ; sulfate as mg/L of SO_4^{-2} ; and phenols as mg/L of the sum of all phenolic compounds present in the sample. The only exceptions to this presentation are the nitrogen species (ammonia, nitrate + nitrite, organic, and Kjeldahl) which are expressed in terms of mg/L of nitrogen. Biochemical oxygen demand (BOD) and chemical oxygen demand (COD) are expressed as mg/L of oxygen consumed during the analysis. Conventions used in expressing concentrations and values for other parameters are listed in the "Definition of Terms" section of this volume.

The analyses are tabulated in reverse chronological order by date of sampling to facilitate use of the most current data.

The index at the end of this report references the location of data in all volumes, as well as the data found in their predecessors (Healy and Toler, 1978a, b, and c). If the location of an IEPA site exactly coincides with that of a USGS station, the index includes the Survey station number in parenthesis after the river name.
