INTRODUCTION

The principal water supplies in western New York are generally composed of ground water and surface water, with surface water sources being more important for urban areas. The primary sources of ground water in these areas are aquifers and confined aquifers that are replenished by rainfall.

The purpose of this report is to provide information on the hydrogeology of the Clifton Park area, Saratoga County, New York. The area is located in the eastern part of the state, near the New York State Division of Water Resources' District Office in Clifton Park. The report includes a geological map of the area and a discussion of the aquifers and their characteristics.

CLIFTON PARK AREA

The area is divided into two main zones: the Clifton Park area and the surrounding regions. The Clifton Park area includes the town of Clifton Park, the City of Clifton Park, and parts of the Town of Saratoga. The area is located in the eastern part of the state, near the New York State Division of Water Resources' District Office in Clifton Park.

LOCATION OF WELLS AND TEST HOLES

This map shows the location of wells and test holes in the area, with each well or test hole identified by a unique number. The map includes information on the type of well or test hole, its depth, and the location. The wells are classified into two categories: public supply wells and private supply wells.
